Hi everyone,
I have a nice 10-80 meter am/cw transmitter to trade.all kinds of
spare tubes and parts. a whole pick-up truck load. this baby is heavy.
a pair of 810's plate modulating a pair of 813's final
amp in push=pull.4-866A rectifier tubes 2-6b4 and other small tubes in
mod circuit.
Also have a Hallicrafters HT-18 VFO.
pickup in taylorsville,north carolina only.
Trade for any hf gear, amplifiers,tuners etc. vhf/uhf stuff. What do you

have stashed away??
thanks for taking time to look.

Hello,

Maybe some of you have tried to reach my web site the last week. I
regret very much that it has been down. Now everything is working
well again and you can search for and order valves, sockets,
components, books etc.

Regards,

Arnold Goks&#65533;yr
DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

Yeah, it was a 3-part series, Sept 1999 through Nov 1999. The radio
was called the DSP-10. There was a follow up in a later issue (not
sure what issue) that mentioned that the radio was either available or
soon to be made available in kit form...

6414. TS-820S ALC problem

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-10-17 19:27:22 UTC
From: Jungwoo Lee x5362 <jungwoo@lucent.com>
Message-ID: <3BCDDB99.F220A763@lucent.com>
Source record: 49311
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I recently purchased a used TS-820S. The Rx part is working OK. But when I tried to transmit (in SSB, CW, and tune), the ALC meter always hits the maximum (it actually bangs to the restraint bar). I could still make a QSO in CW and SSB so there is a reasonable Rf output even though the ALC meter bangs. I am concerned about whether I am overmodulationg my signal.

Could it be that the driver tube (12BY7) needs to be replaced or is there something wrong in the ALC circuitry? Does anyone have any thoughts on how to fix this problem. I am fairly well versed in electronic circuitry.

Hi

Does naybody know of a piece of (downloadable) software to translate circuit diagrams to a PCB layout.

I need only to do the occasional schematic from RadCom etc to make some projects so don't need a complicated professional package like EWB.

Has anyone some suggestions.

Many thanks

Mike

The 50C5 has a 50 volt filament. They were used in line operated radios years ago. I believe they will work with 50 volts on the filaments and 70 or so volts on the plate.
The 12AV6 was used as the detector, avc and voltage amp in radios. I believe there is a version (with a different number) that will work with 12 volts on the plate. It might be fun to see how well the 12AV6 does with 12 volt B+.

Fellow homebrewers,

I can deal with schematics. I can prototype PC boards if I send out the Gerber files and such to a local shop. But the one thing that still baffles me is...

How the FRELL do I create either refurbished or new front-panel lettering and designations that look halfway professional? I don't have the equipment or the skill to do silkscreen or Alodine processes.

Is there specialized software available to help?

Can the layouts be, perhaps, printed on laser printer transparency film, and then attached to the panel in question?

Any suggestions appreciated. Thanks much.

Dunno. How are the readings in the other meter modes? IP,HV , etc? Do
they seem normal? Should see about 60 mils idle, and load up to about
200-220 mils or so full tune. It's hard to say really. Does the ALC
bang the peg no matter what drive level, or does it only bang with
full or max drive? Bangs the peg with normal voice? It shouldn't do
that...I was thinking processor, but that shouldn't effect CW. Dunno,
it's hard to say. But doesn't sound right if it does that all the
time, no matter the drive level. Not sure about the tubes.. I would
think it's probably an ALC circuit problem, but I wouldn't rule out
the tubes. I've seen stranger things happen. Maybe you can find some
6146's and a 12by7 to try as a test. Many people still have old tubes
laying around. But you may have a circuit problem somewhere.You may
need a service manual to get some voltage check points to try. MK

It won't go up to 360 pf, but I recently used one of those chealp
little poly-varicon variable caps that you can find in small radios.
the one I tested went up to about 180 pf and I'm using it to tune a
Variable crystal oscillator in a homebrew DSB transceiver. Cheap,
readily available and small. Glued it right to the PC board.

Bruce---

> How the FRELL do I create either refurbished or new
>front-panel lettering and designations that look halfway professional?

Dry-transfer lettering will work well---That's what I used when I was
doing my science fair project back in 6th grade.

Other than that, you can also use laser-toner transfer paper/film, and
follow the mfr's directions. This will also allow you to make
full-color panels if you print using a color laser printer/copier.

In either case, using a thin coat of shellaq or other clear sealant will
make the panel permanent.

Good luck

If you have about $20 you can purchase a flat-bed plotter like the HP7475 on EBay. You can program the plotter movements in basic -- you create a text file with the "Pen Up" "Pen Down" "Arc Absolute" etc instructions and feed it to the plotter via serial. (ooops, you will need an old computer to do that). If the laminate you are using is smooth enough it will fit right on the bed of the plotter. I don't know if the little motors have enough torque to move a 19" rack panel, however.

I've made PCB's this way with Ultiboard (although some of the instructions have to be modified in a text editor).

HOMEBREW! Monster 8877 amp project 10-80meter, full legal limit, currently operational but not finished! Everything is in place except fabricating a top cover. Large Jennings Vacuum Variables, Huge roller inductor with turns counter. Loads all bands. 8877 is an old tube but has full + output, onboard filament transformer. Gorgeous Simpson matching meters. This is a pickup only in Central Texas. Again, this is a fully functional but not quite finished bone crusher, I have loaded it up during testing on 40m to 1500+ into a dummy load. Power supply is available separately, it is a 5000 volt variable built from QST plans, all the finest parts and looks great. Make offer and come and pick it up. Plenty of PICS available via email, AC5YV@hot.rr.com Will also consider trades for a mobile (high End) amp.

GRAB THEM! Take the tube apart and scrounge the two VERY strong
cylindrical magnets. Make yourself a "stand" with a dowel that goes
through the inner circles loosely, and put the magnets on the stand,
one above the other, reversing their N-S poles so they repel:

After four ovens, everyone who comes to my house plays with my toy
ESPECIALLY adults!-) but kids love it, too

(I'm only showing 4 magnets below):

High SWR makes my TS120 do the same. I adjust my tuner for max power out
with minimum on the ALC meter.

Compose front panel layout on computer with your own customized Logo.

Print it on any color paper or card stock you like. Cut holes where necessary.

Place it on radio's predrilled front panel and cover it with a predrilled 1/16" thin sheet of Lexan or clear plastic. Hold in place with knob nuts, etc.

Cover top and sides of project with a "Hooded" cover (extends out on top and sides a bit to cover the edges).

Beam with pride.

Mark,

Thanks.
All the other meter modes (IP, HV, etc) are normal. I get 60 mils for IP, and about 800V for HV. From SWR power meter, I get about 100W RF output (in CW mode), which kind of indicates that the two finals may be OK. The ALC meter bangs the peg no matter what the drive level is (both Tune and full-power CW mode). In SSB, it bangs the peg whenver I start speaking to the mic. The funny thing is I get 59 signal report in my QSO even in this condition. The speech processor is off so it shouldn't be a factor. BTW, my antenna SWR is about 1.3 so it shouldn't be a factor either.

-Jungwoo Lee/AB2ND

--Mark Wrote----------
Dunno. How are the readings in the other meter modes? IP,HV , etc? Do they seem normal? Should see about 60 mils idle, and load up to about 200-220 mils or so full tune. It's hard to say really. Does the ALC bang the peg no matter what drive level, or does it only bang with full or max drive? Bangs the peg with normal voice? It shouldn't do that...I was thinking processor, but that shouldn't effect CW. Dunno, it's hard to say. But doesn't sound right if it does that all the time, no matter the drive level. Not sure about the tubes.. I would think it's probably an ALC circuit problem, but I wouldn't rule out the tubes. I've seen stranger things happen. Maybe you can find some 6146's and a 12by7 to try as a test. Many people still have old tubes laying around. But you may have a circuit problem somewhere.You may need a service manual to get some voltage check points to try. MK

Probably ALC meter adjustment. Its hard to screw up the
ALC action. As I recall, tune for maximum CW output, then reduce drive for a 10% reduction in output power, then adjust the meter
to read midscale.

TS120 has a very different ALC circuit.

Sounds like you need to get the manual and start digging, but it sounds like the metering circuit.

I used to love those little Curtis 8044B keyer IC's. You could build a nice simple iambic keyer on a 1" square piece of Vector board. Alas, they've been out of production for many years now, and I wasn't smart enough to stock up on 'em when I had a chance. What are you guys doing for keyer chips these days? I need some kind of keyer IC that I can build into a QRP rig, so it has to be really small. I'm familiar with the LogiKey memory keyer family from Idiom Press (I built their CMOS Super Keyer II back in 1990 and it's still my main station keyer to this day). They're way too big for what I have in mind. I've heard of the TiCK units, but I don't have any details on them. Whatever I end up with must be simple, tiny, battery powered, low power consumption, and easy to use. Ideas, anyone?

It's okay to post your responses to the newsgroup, so that other inquiring minds can share the wealth of information.

I wonder if there is any significant difference between keying a 1Khz tone and keying an RF signal?

It seems to me that probably both sides of this issue are correct, depending on how you want to define bandwidth. If bandwidth includes everything that comes out of the transmitter including key clicks that don't contribute to the information transfer then the waveshape is the determining factor. If you consider the bandwidth to be only that part of the signal needed to transfer the information then the keying speed is the determining factor.

It sounds normal except for the ALC action. Something is not right
there, thats for sure. I think it's possible for the reading to be
near full scale," my 830 and other 520's have been near full scale at
full drive", but it should not have any reading with no drive. So you
have a problem for sure. I'd check the power supply voltages just to
make sure it's ok."3.3, 9v" Then I'd start looking through the alc
circuit. I'm curious...Does adjusting the drive change the RF output
level even though the ALC reading stays pegged, or does is the drive
level "pegged" all the time also? IE: in tune, lowering the drive to
zero, should lower the rf output to zero when in tune or cw. This is
one I'll have to think about for a while... MK

>times the speed in words per minute for International Morse Code;
>e.g. at 25 words per minute, the bandwidth is approximately 100 cycles."
>

This is likewise unclear and/or misleading in my opinion unless you clarify the context more carefully.

Does 'proper shaping' presuppose that you are always going to adjust the rise/fall times to a fixed percentage of the mark period when you change keying speed? Is the author giving advice in the context of someone homebrewing a transmitter and determining the optimal rise/fall times of the hardware design - or is the statement implying that for an entry-level ham changing speeds on an off-the-shelf transmitter the spectrum range of the transmitted signal will be wider if he/she keys faster (which is what some people have interpreted this to mean)?

Also does 'necessary bandwidth' mean the energy spectrum of the transmitted signal in space or the filtering bandwidth necessary for decoding the signal at the receiver?

I've followed this thread carefully and still feel that what I call 'sidebands' are only created during the rise/fall time amplitude changes.

My mathematics is not strong enough to prove this on paper - but it's intuitively clear to me that if you do 'superimposition' in reverse - then the CW signal can be looked upon as made up of 3 elements, [a] the unmodulated carrier, [b] amplitude changes during the rise/fall times, [c] the absence of any signal.

It's obvious to me that the EMF 'sidebands' in space are only created during [b] and the squarewave 'modulation' representing the pattern of presence/absence of the signal can (and depending upon the job at hand sometimes should) be viewed slightly differently.

I thought this was a good thread because it encouraged me to explore different ways of understanding some important concepts regarding bandwidth.

I was a little suprized that the mathematically-minded seemed to be the least flexible group when it came to looking at the same concept from different angles (in contrast I suspect that mathematical researchers are used to writing something down first and then trying to figure out whether it has any meaning or not).

Also I was surprized that some people were so touchy about anything that might be taken as criticism of the ARRL handbook (I think it's a great resource too.... but that shouldn't stop us from exploring whether we can add to our knowledge of radio in some way by challenging and testing the concepts we use for our understanding).

When they said it was the ham 'bible' I didn't realize you were meant to take that literally and that it would be sacrilegious to challenge it !

Thanks to all contributors.

No he's not. I can understand exactly what he meant even though it does not correspond with the "x% of the signal's power" definition.

Why not be more flexible in the way we use terminology. You can see what he means and this is how our understanding of technical concepts evolves and becomes more refined over time. Let's not kill the process by quoting a wooden dictionary definition.

It's a long time ago now but I was actually the person who initiated the thread..... and it's very interesting for me that someone with more technical background knowledge than myself can have posted something like this.

This was exactly my point from the beginning. Harry Helm and some of my ham friends seemed to take the statement ""more information means the signal occupies more bandwidth, so keying faster must mean the signal occupies more bandwidth"" to be gospel without really understanding the underlying concepts or in what sense this statement was or was not true.

What we are doing on this thread is tearing the concept of CW bandwidth apart and stitching it back together again to see if it is still the same shape or whether maybe we should be looking at the concept it in a slightly different way.

I just printed the PDF, I'm going to take it to the office today and have a crack at putting it together. Interesting design, the mixer in particular. I've seen the 4066 used before in ELF upconverters, but I didn't know it could be made into such a good mixer dynamic range wise.

BTW: is it just me or do the circuit diagrams not render well? I'll only use xpdf not the official Adobe viewer, maybe it is that. I'll try it on a Win98 box at work.

Mike,

Carefully clean the panel with soap and water and dry it. Clean it with alcohol. Rinse it.

Use rub on letters available at some electronics stores, Radio SNack, or even art stores.

Be very careful because the letters will want to climb of the panel and stick to anything especially as you are rubbing on adjacent letters.

When you are all done, two or three coats of Krylon Crystal Clear will protect it.

An alternative is to learn silk-screening. It is not that hard. I have not done this, but I have done silk screening for art. I think Lindsay Publications has a book on this... After silk screening, the Crystal Clear will protect it.

Clyde, KA1CRV.

Mike,

Carefully clean the panel with soap and water and dry it. Clean it with alcohol. Rinse it.

Use rub on letters available at some electronics stores, Radio SNack, or even art stores.

Be very careful because the letters will want to climb of the panel and stick to
anything especially as you are rubbing on adjacent letters.

When you are all done, two or three coats of Krylon Crystal Clear will protect it.

An alternative is to learn silk-screening. It is not that hard. I have not done this, but I have done silk screening for art. I think Lindsay Publications
has a book on this... After silk screening, the Crystal Clear will protect it.

Hi Bruce

I've used the following method on several frontpanels with success:
Design the layout with the gaphic-programm of your choice.
Print it on good, light-resistant paper (photopaper).
Put it on the front-panel with doublesided adhesive tape.
Cover it with a clear, adhesive foil (I use the one used for book-covering).
Voila, you have a nice, professional looking frontplate.
And if the colors dye out some day because of sunlight or so,
peel the paper off, print a new one and you have a new frontplate.

Hope this helps

Dieter, OE2CDM

> of the signal needed to transfer the information then the keying speed
> is the determining factor.

This is much closer to a workable definition.....

However, we should also consider that practical morse signals have much sharper edges that communication theory would lead us to expect.

If you bandwidth limit morse down to it's theoretically narrowest limit, it then sounds impossibly "soft" and is quite hard to copy.
At this point a Dit has a perfectly rounded top (e.g. has a Raised Cosine shape).
A string of these "minimum bandwidth" Dits has an envelope which is a perfect sine-wave.

In fact we prefer a string of Dits which have a much squarer shape. It as if a certain amount of "click" is necessary to make it copyable.
I figure that in this situation, the theoretical morse sidebands are lost in the other products which derive from the squarer edges.

Or to put it another way.....

The Keying filter is purposefully widening the signal well beyond what the actual morse side-bands require.

When I get time, I'll generate a few examples of different bandwidth morse signals.

Mark---

> in tune, lowering the drive to zero, should lower the rf output to
> zero when in tune or cw.

This is not quite right, at least not on the 830S that I have. On my rig, the drive adjustment simply adjusts the drive tank circuit, matching it to the final input. On ALC in TUNE, DRIVE peaks with relative sharpness, and on RF, peaks broadly. There is slope on either side.

Knob to check: CAR (carrier level). On the 830S I have, it sleeves around the MIC (mic gain) knob. First, turn it fully counterclockwise, then check to see if the same activity occurs. You should get a very small or indiscernible peak on ALC when adjusting DRIVE. If your meter _STILL_ pegs, then its time to look at the circuits involved.

Good luck,

Henry C. Gernhardt, III

I have used Dynamark, but I think it has been discontinued in the last
year or so.

An example is at http://www.owenduffy.com.au/electronics/FlashTNC.htm .
The artwork was created using a PC graphics program... almost anything
will do depending on how flash you want to get.

Have a look at http://www.owenduffy.com.au/electronics/FlashTNC.htm ,
there is a link to a possible replacement.

Owen

6461. Keyer IC's... thanks for the tips, guys!

HARRIS GATES HFL-1000 FLOOR CONSOLE AMPLIFIER. Own a piece of history. Rack mounted amp, Rack mounted matching powersupply in a waist high matching cabinet. 4 (FOUR) Roller-inductors, PA-Tune/PA-Load/Input-Tune/Drive-Tune. Low Drive, 50 watts in gives full out! ALL BANDS! 160-10M with perfect input and output matching. Fully monitored, Step-start and a full set of factory safeties. Currently being used daily with a full output Eimac 4CX1500A, will come with a SPARE full output Eimac 4CX1500A along with the original 4CX1000 with full out. This AMP was built to military specs and will last a lifetime, full set of schematics and manuals. Both amp and power supply slide out and rotate down while still connected to cabinet for access or repair, (awesome)! The amp has been upgraded to a current radio solid state keying circuit. Please email with questions or for additional info. This is a Central Texas Pickup only! Entire unit weighs 400 pounds and I will not ship! $1200 takes it all. AC5YV@hot.rr.com

The Curtis 8044 is out of production, but the 8045ABM (an improved version with selectable A and B modes, code speed meter, and memory) is still available from MFJ (http://www.mfjenterprises.com) for $19.95. If you want to build a traditional keyer with knobs for speed and so forth, you might prefer this to the PIC-based keyer chips that others have mentioned. The PIC keyers all use mode switches and paddle input to control this stuff; great for installing the keyer inside a rig where space is at a premium, but perhaps less convenient than old-fashioned knobs for an at-home keyer.

When I adjust the drive knob in Tune mode, there is a certain range
where the ALC meter pegs. At other range of the knob, I got 0 ALC meter
reading. This means that it is doing some tuning. Another thing is that
the Carrier knob does not change the RF output in CW mode at all. I
don't know whether it is related to the ALC problem.

I've used this method and found it effective.

The only thing that worries me is the toxicity of the fumes and smoke if the PCB starts to discolor, blacken or flame. When I do this now, I play safe with as many safety precautions as I can think of.... outdoors, good ventilation, paint sprayer's mask, stay at arm's length from PCB, turn head away to take long breath, etc... my understanding is that the fumes from the old PCBs can be highly toxic.

Probably. Check if the drive adjustment gives you a broad peak when the meter is in RF mode. Be this the case, your drive cap is fine. Based on what you are saying, I would suspect either the mechanical linkage to the carrier adjustment pot, or the carrier adjustment pot itself.

Good luck,

Careful with PCBexpress.... the version I tested allows you to design the PCB on the screen - but when you try to print the image for etching it puts a masking screen over the output to make it unusable. I think they wished to encourage people to design the PCB and then send them the data and pay to have the board manufactured for a fee.

Same thing I meant. What I called drive, I meant as the carrier level. I guess a bad choice of words being as they call the preselector "drive". MK

Ok, Then you have a problem. The "drive" as they call it is pretty
much a preselector. So in your case that is working properly. It's
your carrier control and related circuit which is not acting right.
That should be controlling the drive level, and should drop the output
to zero when it's all the way to the left. It could be related to the
alc. Probably is being your alc indication is very high. I'd start
looking around that point. Somethings not right, thats for sure. MK

I have seen a number of ALC problems of this nature on 820 and 520 rigs..You need to get a service manual, go to RF unit and locate Q5 the ALC meter amplifier, it is a 2SC1515 . check all voltages on Q5, you will be able to isolate the problem..If voltages are not near normal I would change Q5..Good luck , by the way it will work great when you get it fixed, hi. Making a PIC-based keyer with a knob for setting the
speed is easy: have the knob adjust the processor clock
frequency (say, a pot in an RC oscillator). PICs are
static inside, so you can run the clock as slowly as
you like.

What other knobs would you need?

:
: Ok, Then you have a problem. The "drive" as they call it is pretty
: much a preselector. So in your case that is working properly. It's
: your carrier control and related circuit which is not acting right.
: That should be controlling the drive level, and should drop the output
: to zero when it's all the way to the left. It could be related to the
: alc. Probably is being your alc indication is very high. I'd start
: looking around that point. Somethings not right, thats for sure. MK

If you take the Car level full counterclockwise and you have still have
power, you're oscillating. Do a neutralization, then take a hard look
at your PA and Driver/coil pack assy. If you have one try subbing
your 12BY7.

I would suggest looking into programming your own with a PiC (one-chip microprocessor). The time and expense required for building a PiC programmer and learning how to write the code is modest. This capability will probably open doors for you on future projects. The PiCs have a short instruction set and are ideally suited for this type of hardware control application.

If you want something very simple then the programming is easy. If you want more sophisticated functionality (e.g., restrospective validation of marginally-too-early fast keystrokes) then you need to spend a little more time on the software. Having said this - the only commercial keyer chip I ever tried (purchased at a hamfest) had poor performance in this respect and there was no way of modifying it - so with a little time and effort I suspect you can 'homebrew' an autokeyer to the same if not higher performance standards.

Thanks for an interesting graphic presentation.

I think the 'wavey' noise in the earlier graphs is perhaps the result of the relatively rough resolution of the data in the wavefile itself. If you do additional experiments then maybe a higher sampling rate might produce smoother graphic results. (Just an idea.)

==========
Indeed ,when using a propane/butane torch , the PCB gets 'attacked' with the
resulting toxic fumes .

When stripping PCBs to salvage components I use a hot air paint stripper
.The one I have is a Black & Decker ,1600 Watts. The paint stripper's nozzle
is kept 4 -6 inches away from the PCB.
If done diligently the PCB is not damaged. However this method might not be
the best when replacing multi-legged components on a board to be reused
(repair job).

> receivers?
>

Look for the Crystal Set Scoiety on the 'net. They had a run of 365pF variable caps made a few years ago, and they sell them for something like $13 each. Not dirt cheap, but readily available. I had three (gave one to a guy building a glowbug regen), and my only grumble is that they should have made the shafts longer. Unless you bolt one right to a thin panel & have a knob right on the other side, the shaft isn't long enough! The best thing I've found is to use these with one of those cheap 8:1 reduction dials that have the shaft socket extending out the back, but the layout is still fussy because of that short shaft.

As to other values, Dan's Small Parts (on the 'net) has 50pF & 15pF units for reasonable prices, but these are surplus with uncertain future availability (if you expect to need eventually, buy now). MFJ Enterprises might be worth a contact, they build their whole line of ham-radio antenna tuners out of 208pF 1kV air variables; obviously, they have someody making them by the hundreds, but I don't know if MFJ could be persuaded to sell one seperately.

And, as others have suggested, if you can find "junker" old tabletop AC/DC AM sets, they all used similar tuning caps, with the larger (antenna) section going 365pF, and the smaller (oscillator) section going 135pF. If you parallel both sections, you get 500pF maximum, useful for the "Antenna" cap in the pi-network of transmitters, even up to 200 watts or so.

> What other knobs would you need?

Yes, that's true, if you're rolling your own. All the commercially available PIC-based keyers I know of, though, use the mode-switch and paddle entry approach. Furthermore, most of them are using the little 8-pin PICs where the oscillator components are built into the chip; you can use external components, but the chip has to be programmed differently to tell it so, and you lose a couple of I/O pins that you can't really spare. So you can't just take a TiCK or a K1EL chip and change the speed that way.

Back in the old days, you would see keyers with knobs for speed, weight, sidetone volume, and sidetone pitch. (I have a homebrew one built back in the early 1980s, using an 8044B chip. It has two knobs on the front - speed and volume - and two more on the back.) You couldn't do all of that with your approach. (In fact, you couldn't do a keyer with sidetone at all, since the sidetone pitch would change along with the keyer speed.) You COULD do it by using a fancier PIC with A/D converters and connecting the pots to the converters, and it might be a fun homebrew project if you're into microcontroller coding, but it's a lot easier to just go out and buy a Curtis chip if you want that sort of keyer.

True, sidetone isn't usually an issue when using a keyer with modern rigs - they all have it built in. I built mine back when I had a Swan 400 transceiver, which didn't have it. Keyer sidetone is also handy for practice sessions and code demonstrations - situations where you want to send code without involving a radio.

6486. 80M SSB radio in Northern Alberta/BC

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-10-20 18:58:52 UTC
From: b_t_s@hotmail.com
Message-ID: <3bd1c930.106126265@pen6.pen.k12.va.us>
Source record: 49285

I was wondering how useful a portable radio would be in that area (I've heard that in NE Canada a lot of people talk with each other on 80M). Would another band be better such as 160M or 40M, etc? Would it be possible to tie in to satellites in that area?

Source record: 49286

Fortunately or unfortunately, I haven't had the time to follow this thread. It's what I call a "high Q" thread, since it keeps ringing for a long time once struck.

There are several ways of looking at bandwidth, time waveform and frequency spectra. But the controversy began, as I recall, when Tom W8JI said that he observed that the spurious signals generated from a CW waveform, when he tuned his receiver off frequency, changed as the risetime changed but not as the keying speed changed. This was followed with wonderfully crafted arguments explaining why this couldn't be, and at one point Tom was even called an idiot or some such.

I've missed a lot, but I'll bet no one has done the same experiment Tom has and gotten different results.

The problem is this: If you listen to a CW signal off frequency as Tom did, the circuits in your receiver will ring when an edge occurs. But the time constants in those circuits is short enough, at least in the case of CW of reasonable speed, so that the effect of the edge is for all practical purposes gone by the time the next edge occurs. No matter what wonderful equations you produce and bandwidths you calculate, the fact is that the receiver doesn't remember how long ago the last edge occurred. So how could it have a different response to an edge depending on the speed? The only way it could is if the effect of the previous edges were still present in the receiver circuits when the next edge occurs. And it isn't.

A spectrum analyzer is a receiver, but a very specialized one. But as I posted long ago on this thread, an amateur receiver isn't a spectrum analyzer. Tom heard what he said he heard, and I believe he's right in asserting that what we really want to do is reduce the garbage other hams hear with their amateur receivers. And slowing down won't do it.

I have three new power transformers that would be ideal for a solid state kilowatt RF amp, high power audio amp or monster bench supply. These are real beauties, but very heavy - so you wouldn't want to pay for shipping. Pick-up only in Seattle area. Specs are as follows:

(Primaries are the same on all three - dual 100/115V (200/230V), 50/60Hz.)

Xfmr #1:

One 55V secondary, tapped at 4V, 40V, 45V and 50V. Rated at 250A peak (6% duty cycle), using a bridge and 150,000 uF cap.

Xfmr #2:

Secondary #1: 50V, tapped at 30V, 40V and 45V. Current rating not known, but substantial.
Secondary #2: 28V center-tapped at 8A continuous, 50A peak (20% duty cycle), using a bridge and 50,000 uF cap.

Xfmr #3:

One 55V secondary, tapped at 4V, 36V, 40V, 45V and 50V. Rated at 100A peak (20% duty cycle) using bridge and 50,000 uF cap.

If interested in any of these, and able to pick up, contact me, and we'll work an easy deal.

Source record: 49290

I have 2 different models, depending on what I'm using for a case.

For an aluminum front panel, I print the panel in reverse on transparency film. When I can find film heavy enough, it's generally sufficient to allow the controls to hold it in place. Usually the panel gets some protection from the sides of the case so this is OK. If not, a little glue or something is in order.

See http://www.qsl.net/wb8rcr/NC20.html for an example of this.

More often than not I use plastic cases from B.G. Micro or Debco. These are different style cases but the share the feature of having a simple, flat piece of plastic for a front panel, usually textured black (which makes it hard to do something with). I replace the panel with a piece of Plexiglas and print the panel on glossy paper (gives more intense colors) and attach it to the back of the panel. Plexiglas is pretty expensive if you buy big pieces but often scraps adequate for several panels are available at the local hardware for a quarter or fifty cents.

See http://www.qsl.net/wb8rcr/2N2-40.htm for an example of this.

I used to use Micrografx Designer but once I wrote the Panel program it became much easier. See http://hfradio.org/wb8rcr and poke on the Panel menu choice.

After struggling with TiCK and similar keyers I longed for the knobs of my old Heathkit keyer, but then I got a K1. This has up/down buttons for speed, and simple combinations of buttons for loading and sending the memories. The mode and sidetone pitch are set from a menu navigated through the radio's LCD.

After using it for a while I realized I like this approach a LOT. It's easy and quick to change speed with the buttons, and you get feedback through the LCD, so unlike the keyers with knobs, you can easily go back to a previous setting. Things like weight and sidetone are harder, but you don't do that very often so I don't see it as a problem.

I'm building something similar for a homebrew radio using a PIC and as Laura says, it's pretty simple business. I am having a code problem at the moment but I'm sure it's something obvious so sooner or later I'll lick it.

6495. AM-FM transistor radio circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-10-21 03:38:27 UTC
From: nope@sor.ry
Message-ID: <tt4gpjp3ueii91@corp.supernews.com>
Source record: 49292

Hi, I'm looking for something to do while being unemployed, and I've decided to build an AM-FM transistor radio-one that DOES NOT use ICs, so that I can tinker with it and not have to worry about blowing an IC. I spent a day at the library, both in books and on the web, and found nothing. So I was wondering if anybody here has a circuit that I can use. I'm sorry that I can't post my email, but if I do I'll be spammed to kingdom come. Post here and I will email you.

I have been getting the front panel black hard anodized, Then take it to the
local trophy shop with a TIFF image of the panel and have them laser etch
it.
It's not cheap but it's not to expensive ether.
The anodizing house has a $40 min. so I usually get a few done at the same
time for the same price.
The laser etching runs about $10 depending on complexity.

Peter,

This is an excellent article, and the mixer looks very promising to use in future projects. One thing I *really* like about this article, is that you actually explain how you arrived at your choices among some of the alternative possibilities for various stages of the receiver. One of the things I *really* like about the article is that it allows a peek into the way you go about doing receiver design creatively: the art of of radio. Thank you!

I would say it will be an "unreasonable fee" judging by the Motorola dealers I have competed with over the years. Typically $75 per radio, even in large numbers. My shop made good money programming Motorola radios because they charged so much.

I noticed that an FM circuit is a lot of work. My experience is in amateur stuff-I never noticed that a regular AM/FM radio is a single IC chip that does all the dirty work plus a bunch of resistors and capacitors. But last night I took apart my cheap little bicycle radio to see why it didn't sound right and I noticed the big chip in the middle and the rest of it just electrolytic caps and resistors. (The answer: the tiny little speaker inside the case is overdriven. I'll have to get an actual size 8 ohm speaker for it, instead of one that's for a buzzer.)

Actually, the whole thing was for naught-I was digging through the piles looking for a long shaft screwdriver when I found an old Zenith Royal 45 that's AM-FM and uses no chips, just 9 transistors. My point was to find a radio that could be used for disaster listening and that could take a little roughness. By the way, can anybody tell me how old this thing is? It still had a garage sale sticker on it saying "$2.00 RADIO".

6509. B&K 1601 Power Supply

I'm having a pretty nasty problem here with interference from computers and want to get some ideas on how to deal with it.

We have three computers in the house, all three were built by me and are mostly identical - one server and two workstations. One workstation is in my room, one in my roommate's room upstairs, and the server is in the front room, about twenty feet away from my room.

The workstations are bad enough, but when the server is on, you can't receive anything on the AM broadcast band at all. The entire band is covered in interference, and not even our strong local (WJBC, that can usually get through *anything*) can be heard. The interference is pretty much a problem up through 8 or 9 MHz, and some howls from the computers can even be heard on the FM broadcast band.

I've tried moving the server farther away, no change in the interference.

How can I determine if the interference is coming through the AC line, radiated, or both -- and what's a good way to get rid of it or lessen it? Build non-switching power supplies?

Getting rid of the computers isn't an option, darn it . . <g>

thanks,

Computer interference.... Nasty stuff to get rid of. A lot of the
cover joints are not RF shielding by any means.

==========

As an interesting side note, I was trying to run an FCC type acceptance
test in a spread spectrum radio that connected to a computer via RS232. I
set up a test bench, antenna was 3 meters frum the unit under test and so
on. Turned out, NONE of the computers at my workplace were quiet enough to
pass the FCC test !!!

The radio was OK, but the computers generated so much RF that any attempt
to test the spread spectrum radio would fail. I finally had to use a
plotter that had an RS232 input port. This satisfied the FCC requirement
for a 'typical load device'....

==========

From your description, it seems likely that some connection to the
computers is acting as an antenna.

OK, so the first thing is to disconnect the network cables. that's an
obvious and LONG antenna lead.

Make sure to shut the other computers off first, so you are chasing only
ONE problem at a time. Let's debug the server first.

Assuming that doesn't solve it, then get a good AC line filter. The
usual surge supressor in the AC strips is not good as an RF filter, so make
sure it is marked as an RF filter for the AC power.

Try that on the server.

Oh yeah, disconnect the speaker wires too.

It is likely that one of these will reduce the RF noise to an acceptable
level. If not, then it is possible it is coming straight off the main
motherboard. In that case, it might take a lot of copper tape to seal up
the joints. Alhough I'd check out the covers and the front of the
computer first to make sure they are metal and not molded plastic.

Has anyone seen any sort of DOS program that will provide a pulse
generator function via the parallel port?

I need to output a vartiable pulse on each of 3 to 4 pins of a parallel
port in succession. I want to be able to delay each of the pulses (1
event per pin) to follow a trigger (keyboard is OK) and each other. Both
the delay and pulse width need to be variable from about 10 milliseconds
to 1 second in 10 millisecond steps.

The example below is for 3 output pins, more would be nice but not
essential.:

Trigger
wait 250 milliseconds
pin 1 output high for 80 milliseconds then stop
wait 100 milliseconds
pin 2 output high for 70 milliseconds then stop
wait 90 milliseconds
pin 3 output high for 60 milliseconds then stop
Stop

Thanks

Try using an RFI sniffer, see
http://www.geocities.com/wa2ise/radios/ham.htm
for details. It's a ferrite toroid with a gap, the gap
is the sensitive part. Tune a receiver to an offending
frequency and probe around with teh sniffer to find
where the RFI is comming from.

6514. Power transform markings ???

Newsgroup: rec.radio.amateur.homebrew

Hello, all.

I have a power transformer (secondary 12.6V, 3A - no center tap) that I purchased from Radio Shack several years ago but have never used (RS catalogue number 273-1385). This is a PCB mount transformer with four solder tabs on the bottom (two on one side of the core frame and two on the other). This appears to be a discontinued item as this part number is not in the newewst Radio Shack catalogue.

It is not clear to me which solder tabs are for the 120V primary and which are for the 12.6V secondary.

On top of the core frame is written the following three lines:

PRI - 120V - 60Hz - CPT - 231
273-1385 LR38809 [CSA
SEC - 12.6V - 3A LOGO]

(Note: The "CSA LOGO" is the Canadian Standards Association logo; kind of like the Canadian equivalent to the U.S. Underwriter's Laboratory logo.)

If I hold the transformer so that I look down on it with the writing on top of the core frame "readable" (i.e. "right-side-up") then the left solder tab on the side of the transformer toward me, is marked with a red dot.

How do I determine which solder tabs are for the primary and which are for the secondary? What does the red dot mean? Is there a simple way to determine the primary and secondary by measuring the resistance of the windings?

Please follow up to these newsgroups, and also please CC a copy to my E-mail address.

With thanks and regards,

Measure the DC resistance of the windings with an ohmmeter (it may
take a second or so for the reading to settle, due to inductance.)
The higher resistance will be the primary for this transformer.

One of the worst sources of RFI from a computer I've had to deal with turned out to be the video cable. Unshielded. I couldn't believe it. But the others are
right on how to track down some of it. Unplug cables from the box and see which one(s) is(are) the antennas. The RF sniffer project listed in another reply is a good project. I've built one for myself and it works as advertised.

The method to keep the noise inside the box usuualy means a trip to radio shack for a few of those split rectangular ferrite clamp filters ($15/two) well worth it.

Worst case involves spraying the insides of the boxes with conductive paint
(sold as EMI shielding in a can) and making phospher bronze leaf springs to make contact with the paint when assembled. And yes, sadly, that includes the monitor, keyboards and mouse.

Funny, the worst ones were the old AT computers,. since they ran between 5-10 MHz clock rates. the newer ones are so fast, they only affect the cosmic radiation. (And a heavy Marie Callendar pie tin for a hat cures that.)

jeff

Side note: I remember when Southern California Edison used to send out an employee with a Collins KWM-2 in the service vehical and they'd hunt down the source of line noise for ou if you bitched loudly enough long enough.

Hi all
I would like to adapt my home made receiver control programme to a
friends FT757 GX II.
Could anybody do me a favour?
I send a SASE and contribute to the copy expenses.
Would you make and send photocopies of just the manual pages which
describe the control protocol.
(Commands, handshake and connector).

It would be very nice to help me in this matter.
If yes, send me your snail mail address via net mail.

Thank you in advance

I can scan the pages and send them to you by email
(5 pages, 500k per page in .jpg format)

What do you think?

I'm sure your friend knows that he needs an interface between rs232
and the radio?

I have the FIF-232 interface by Yeasu
I use only 3 pins on the connector in the back of the radio:
pin 1- Gnd, pin 2 - S.out, pin 3 - S.in
be sure to shield your cable.

In my experience Radio Shack transformers should be derated 50%. That
is, if yours is rated 3A don't try getting more than 1.5 amps out of
it. I have had some literaly fry. Yes, it actually turned crispy
black!

I rememember a guy in high school that could identify any transformer. His technique is well worth passing on. 1) Identify the windings on your unknown transformer with an ohm meter, and draw a diagram of it. 2)Get another transformer that puts out 6.3 VAC. 3)Pick two connections on your unknown that are on the same winding and hook them to the 6.3 VAC (If the thing catches fire with only 6.3 v, you probably don't want to use it anyway) 4) Measure the voltage on the other windings and keep track of them on a diagram. *****DANGER---There may be high voltages present. Use extreme caution when doing this. I have learned the hard way---HV does not feel too good!!***** 5) Calculate the voltage ratios on all the windings. With a little mathematical gymnastics it is then possible to identify whats what.

Unless the transformer is a real oddball it should fit a common pattern. Look in transformer catalogs, old Radio Handbooks, etc, for circuits that use similar transformers. Old ARRL Handbooks also have the color codes for transformers with wire leads.

I've done this a few times...

A few things to look at and try..

replace the glass monitor with a LCD flatscreen.. you might laught at first but the big o'l monitor puts out a termendous amount of RF. I have 7 radios arranged on shelves right over my monitor. Before I replaced mine, I could not use any of the AM rigs. Even the FM would get some fuzzyness based on where the power cord was laying at the time.

Get a real CERTIFIED pc case for the server.. the clone cabinets are garbage for RF shielding.

Tape ALL joints on the PCs with EMI tape.. (copper tape) anyone who works in RF knows what this stuff is. Very handy.

Voodoo beads on the keyboard, mouse, montior leads.

Add RFI filter to the powersupply(lot of work but doable)

Again, you might laugh but a piece of tinfoil under a radio might help.. I *fixed* a guys garage door opener by placing his clone PC on a 2x2 piece of foil. It was sitting in the 2nd storey floor right over the opener's controller. With the PC.. the controller refused to work. With the foil in place, works great and last a long time :)

The biggest issue is the cases and glass monitor... we use to wrap copper tape around the perimeter of the monitor and then attach it to a ground drain to try to reduce in the radar vans. Not pretty but it worked to a degree.

Since the windings come out to the terminals,
one can actually see the wire that is used for the windings.
The secondary should have thicker wire than the primary.

I have a Radio Shack transformer in front of me, which has all
the terminals on one side (I couldn't find one like yours, which
also had the labelling on top). The primary is the top set of
terminals (verified by the thinner wire for the winding, and
the center tap on the secondary). The label on the top of
the transformer has the primary voltage listed first, making
me wonder if on your transformer the primary terminals would
be ones with the primary labelling closest to them. I wouldn't
count on this, but it is secondary imnformation.

I have 3 networked computers, and I had a really severe interference problem that would disappear if I networked only two computers with a crossover cable. I traced it to the switching power supply for the network hub- it was a little transformer-looking thing (a wall wart) that plugged into the wall, which actually turned out to contain not a transformer, but a little switching power supply. I replaced it with a 5v. supply made out of an old filament transformer, and the noise just disappeared like magic.

It's a Linksys hub.

In the undisclosed town where I ran a Kenwood dealership, the local MSS was it's own worst enemy. Their attitude was better than a large advertising budget on our part. Even new Moto radios bought from them had a $75 programming fee tagged on for EVERY one. They didn't even like to talk to hams about radios, unless you knew the owner who was a ham and were in his "clique".

We programmed all our radio sales for free, and made reasonable changes for free during the life of the radio. For a competitor's sold radios we would charge a few bucks at most, and for a large quantity we did it for the current bench rate. For Ham's that were not pests it was usually free, provided we had time. They might have to wait because customers took priority. However, there were a few hams that wanted reprogramming every couple of days, and didn't care if you were busy- they paid the same rates as the customers. They really should have bought ham radios that were self programmable...

I agree with everyone else, those switchers cause a lot of noise. But on the bright side a quality name brand computer (no clones) is usually quiet enough not to cause problems. Both the monitors and network seem to be pretty quiet.

I did get rid of my problems rfi problems by using a shielded antenna - rg59 from the radio to the 20' wire on the roof and tuning the antenna with a low Q 1000uh choke. This worked well - for the better quality radios that were properly shielded and didn't use an internal antenna.

Good luck
Werner

> event per pin) to follow a trigger (keyboard is OK) and each other. Both

Bit tricky.

> the delay and pulse width need to be variable from about 10 milliseconds
> to 1 second in 10 millisecond steps.

Rather tricky. You see, a natural DOS machine really doesn't like
timing any tighter than about 55ms. But it can be done. If you
don't need any simultaneous processing (your example below doesn't)
then you can use a self-calibrated "busy loop" to just wait.
Otherwise you probably need to reprogram the interrupt timer and
then you bollux any compatibility with most other software (e.g.
networking) that you might have running.

Are you a programmer? If so, you could probably roll your own
custom programs fairly easily (except for the tight timing, but once
you got that the rest is not too bad).

> Trigger
> wait 250 milliseconds
> pin 1 output high for 80 milliseconds then stop
> wait 100 milliseconds
> pin 2 output high for 70 milliseconds then stop
> wait 90 milliseconds
> pin 3 output high for 60 milliseconds then stop
> Stop

It would be nice to have a program that would parse and execute
scripts something like that. (BTW, when you say "stop" you probably
mean "output low", right?)

I had the same problem with the wall wart for the hub. We returned it for another of the same model but this one came with a transformer type and the noise was gone. I also had a computer with a very noisy power supply so I bought another brand and noise was gone.

Hi,

one thing that may help is an external 1kHz oscillator. You can use this to trigger a tight loop of code to do something. You will need a fast PC to keep up (at least a 386 40MHz, not an XT or AT). This will mean you don't need to alter timer settings etc. I presume you will have an external circuit to use your outputs anyway, maybe a 555 of other oscillator will be do-able. If you're carefull you can power it from unused outputs.

James.

HI all,

I have a quantity of Fujitsu PLL chips made in 1994, the MB87080A.
Unfortunately the Fujitsu site doesn't have data for chips back then.
Does anybody have an old printed data book or other source of data
with the information please?

Thanks in advance
Richard

Hear! Hear!

In addition to being enormous fun to play with, this is one
way to make absolutely sure you get the keyer you want. You
might even come up with something genuinely new and interest-
ing in the process.

If nothing else you would be creating something yourself,
rather than just buying an appliance off the shelf. This
doesn't happen enough nowadays, and is to be encouraged.

I found some Murata DFC3R915P025BTD drop-in replacement filters for the 900 MHz amateur band Maxtrac modification. I was tired of adapting the TOKO 4DFB-915E-10 surface mount type. Although the TOKO do a fine job, the full size Murata have about a dB less insertion loss and should improve sensitivity.

These are NIB, exact form-fit and function of the two filters we remove from the rf board, except they are the proper frequency bandpass for the amateur band (same part number listed on the Batlabs site). Willing to share excess.

Have a Jpeg if anyone is interested.

Ed,

If you have access to the winding and can see the wires coming to the solder taps, you can easily identify the primary w/o any instruments. The wire of the primary winding will be thinner then the secondary.

As a calibration point, it IS possible to have a quiet PC. I have a
semi-name brand inexpensive e-machines 400MHz computer on my bench. My
radios play interference free down to about 2 feet away. I don't have any
auxiliary filtering do-dads attached. This is a basic PC with monitor and
modem, no network attachments. I get some static from the shop-light
flourescents overhead but it isn't bothersome.

It's most likely coming from the power supply. I have a homebrew 800 mHz Pentium III computer that has a "smart" power supply, which means that even when the system is turned off, a portion of the power supply is still energized.

The RFI generated by this thing is just outrageous. The AM band and most of the most popular SW bands are completely useless when the computer is connected to the AC line, even when it is switched off. The only way to get around it for me was to hook the computer to a seperate power strip and switch it off there.

At some point the FCC is going to have to get some backbone and start cracking down on this sort of thing. I like computers; they are wonderful things, but the RF noise pollution they generate is just brutal, and other electronic toys aren't much better. I can't believe that these things can't be designed to behave better with radio equipment.

20 years ago, the biggest problem with interference came from microwave ovens, car ignitions, electric motors, and flourescent lights. These things were annoying, but you could still copy a signal through the interference. Nowadays, If you live in an environment with a lot of computers around, you might as well throw the AM radio out the window. Something needs to be done on a broader scale.

I've had this problem several times, and it's always been the power
supply. Some of them just don't have a line filter. Often there's a
place for it, jumped over. I have 6 dead power supplies!

So I goes me down to the computer store and get one that has an
EMI filter, guaranteed.

The racket a switcher can generate is awesome!

Mike Predyko's updated PIC book contains a PCB for a programmer, and a
CD-ROM. Just add parts and a connector and you're good to go.

```
List Of Stamp Applications (L.O.S.A for short)
==============================================

If you have done something (big or small) with the BASIC Stamp
that you are willing to tell others please use the form below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better
but not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill
in the L.O.S.A form on the Web-page...

http://www.hth.com/losa/

The latest version of L.O.S.A is always available at the above
URL as an ASCII file (or ZIP-file for easy download). An index
of L.O.S.A is posted to the following mailing lists and news
groups. It's updated it approx. once a month.

Mailing lists:

BASIC Stamp Mailing List

News groups:

Ok Clint; you don't have to charge anyone for any professional service like boat/RV repair, Waiter, Electrical, Plumbing or even to build them a house in the country if you are
either independantly wealthy, have a filthy rich parent or are heavily subsidised party elite or movie star (or perhaps your time is over-valued?).

As a Brother Ham, I was wondering if you had a spare mansion in Beverly Hills and a pension for me to retire to? (I noticed Bill C. went to New York instead)

Pardon the belch;

<soapbox>

All that seems to be changing for economic and security reasons, etc. Now they just get rid of the technicians and substitute installers, and ship the radios away to a depot where they perform a wholesale flat-rate repair. This way, security is maintained while employing wetback, kid, prisoner or volunteer for manual or less skilled technical operations like mobile installations and "picking frequencies", or even a god person such as a federal agent or police officer who may have any of the above executed for touching one of "his" radios.

One side-effect of this, is that when a sophisticated system goes down, the search is on for a competent repairman, as many have disappeared since the system was first put on line. Someone may in fact have to be flown out while the clock is ticking. Of course the ultimate answer to all this would be a complete phase-out of privately owned systems completely, and complete takeover by carrier owned systems with leased portable units such as Nextel or a few of the cellular carriers.

This almost does away with the slave labor, because the portable unit doesn't require installation, and can be easily shipped to depot level for programming and repairs.

All this cuts the overhead and "problem" of having to hire someone just to program radios, change fuses and replace antennas (and occasionally to fix a repeater, dispatch console or link) who may need to be shot in the head as a security "concern" by virtue of excessive experience.

The book he's talking about is "Programming and Customizing PICmicro Microcontrollers", second edition; Myke Predko; McGraw Hill, 2001; ISBN 0-07-136172-3, US$49.95.

It contains an actual PCB for the "El Cheapo" programmer, though not the parts to populate it, and the schematic for the programmer. The parts you'll need include resistors and capacitors (all common values), 2N7000 and 2N3906 transistors, two 1N914 diodes, a 78L12 regulator, a 5.1v Zener, IC sockets, and a DB25 connector for the parallel port connection. You'll also need a 15 volt supply of some sort; a "wall wart" will do. A well-stocked homebrewer will have most or all of the parts on hand already.

The programmer works with all the PICs that use the ICSP two-wire programming method, which includes all of the currently popular parts. It handles 8, 14, 18, 28, and 40 pin DIPs. (Sorry, it doesn't handle surface-mount chips; nobody makes sockets for them. But if you could figure out how to connect them, I'm sure the circuit would program them.)

6553. Amateur needs simple FM transmitter...

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-10-23 21:37:30 UTC
From: anarchyx@escape.com
Message-ID: <3bd5e1c6.172249351@news.mindspring.com>
Source record: 49100

I'm somewhat of an amateur at all of this, so bear with me please.

Anyway, I'm addicted to streaming radio stations and I want a way to be able to listen to them all over the house and not just near my computer. So I figured an FM transmitter would be perfect. It seems that they're harder to come by than I thought. I came across this: http://www.ccrane.com/fm_transmitter.asp. Seems like it would serve my purposes nicely. There are 2 problems with it though. One is that it would only transmit about 20ft and requires some modifications to reach the whole house. Modifications dont scare me, so that's not really too much of an issue. The other problems is that it's not available until January. I was hoping to get something sooner.

So does anyone know of any other solutions I can try? My requirements are this:
-Must be able to broadcast about 100ft.
-Must be in stereo and sound just like a real radio station would, if not better.
-does not require an electronics engineering degree to assemble/install. I'd really like a plug and play solution.
-Cheap would be nice too :)

Any help is greatly appreciated. Thanks.

Thank you verry much for all your help... I think i am going to go for the noppp programer... seems to be a good compromise ...Cheap to make programs a midrange family chip and i suppose with a little bit of work i could get it to program others as well...as for the idea of using a uv erasable or eeprom i had not thought about that... Of coarse there are no local suppliers of the chips the one place i went to said they could order them in for me but do not carry them onhand...so what price range would be fare for the 16F84, 16C84, and 16F83 microcontrollers Thks again... kc7eip

A friend and I are starting to design a 40m (single band) transceiver. We'd like it to be able to put out somewhere near 100 watts. I've used the MRF454 transistor before and it seems just about perfect for the job (5W in, 80W out, 30 MHz), but it looks like Motorola doesn't make them anymore.

Can anyone recommend a good choice for a device to use as the final in a 100W 40m transceiver? I'm open to suggestions but what I have in mind is a single bipolar transistor biased class AB with a tuned output circuit, followed by a filter.

Thanks...
David

Check Radio Shack. They carry speaker wire in nice long spools.

Any low power transmitter is just asking for hassles with noise,
positioning, etc.

6560. Transmitting through the ground

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-10-24 10:04:09 UTC
From: Will Godfrey <will@omicron-technologies.co.uk>
Message-ID: <3BD69219.6040907@omicron-technologies.co.uk>
Source record: 49158

Hi,

I apologise if this is the wrong group for this type of thing but it seems to be the best fit.

About 15 years ago I played around with what I was told then was called "Ground Effect". Basically you placed two metal plates in the ground seperated by about 5 metres. You then wired your audio amp outputs to these plates and played 20w of music into them. The resulting audio could be picked up using another two metal plates and an amp, allegedly as far as a mile in damp weather. I only ever managed about 100m on a wet day.

Does anyone know of anywhere I can find more info on this and is "ground effect" the right name for the technique? Secondly is it legal in the UK and would it interfere with, say, amateur radio enthusiasts using a grounding plate?

I was thinking about maybe setting up a simple link between 2 computers by writing some software for the sound card to be used as a crude modem.

Thanks,

Will

Odd. Must be an industry thing. I was assuming it was an IUPAC name or abbreviation thereof, in which case methylbenzanol or hydroxymethylbenzene would be correct. Benzanol, by the way, is simply benzene alcohol (IUPAC convention).

> >Clorox also had (has?) a product which is 5% NaOH!.

> of Clorox is a perfect example.

Thanks for the refresher! I had forgotten about weak base/acid equilibria. Tells you how long it's been since I've actually had to _calculate_ anything chemical. :) In any case, the product to which I was referring actually did have added NaOH---It stated so in its label contents. I got the percentage by calling Clorox's product information line.

Again, thanks for the corrections/refreshers. My chemistry is quite stale, and I don't wish to spread misinformation.

The closest I have is a chaser for a set of 16 LEDs which updates at 1 second intervals. It is written in assembly and runs happily on an old XT computer under DOS. I have also modified it to run a stepper motor, but as yet this has not been tested because I have to build the power drivers which provide the interface between the printer port interface to the LEDs and the stepper motors.

Don,

Once I found out the method was called 'earth current loop' from the web site you posted I found quite a bit of information through out the net. Thanks.

Probably old news to people on this group (so don't all moan :-)) but this site looked kinda of interesting with regard to VLF.

http://www.stormwise.com/transmitter.htm

I'd still like to hear peoples experiences with earth current and VLF transmissions.

Cheers,

Will

I was shopping at the local Active Electronics store for some
PICs (I'm building a Blick prop clock), and they had both 4 and
20 MHz 16F84 chips available. Someone had marked (OTP) on the
4 MHz chip, but I didn't think 16F84 was available as OTP.

The clerk didn't know for certain, so I bought the 20 MHz unit,
just in case...

This is a doddle with V3 of Borland C.
I did this a couple of years ago to
program up the synthesizer and
micro-stepper in a GSM phone
prototype.

Assuming that you have a modern PC,
one in which the dynamic RAM refresh
is done by a memory controller, then
disabling the interrupts is a good idea,
otherwise your timings go to pot.

Even with interrupts disabled, there is
still a jitter of a few microseconds on
the timing, which I put down to cache
fillings up.

The "OTP" marking on the 4 MHz 16F84 chips is an error. There is no such thing as a one-time-programmable 16F84, since they use flash memory. I bought a couple of those chips from Active, and they erase and reprogram just fine.

On the other hand, they seem to charge the same price for the 4 MHz and 20 MHz chips, so there isn't much reason to buy the slower ones. I bought the 4 MHz parts that I have before they started selling the 20 MHz chips.

So far, Active only offers two flash PICs: the 16F84 (4 and 20 MHz) and the 16F877 (4 MHz only). They do have quite a few varieties of windowed EPROM and OTP PICs. Signs in the store claim that new varieties are coming soon, but they have claimed that for months.

The same principal as VLF communication used by the US Navy to contact subs
at sea.
They use 75khz at about 1-2Mega-watts. From large antennas very close to the
ground, not nessarily near the ocean.

Hi,

This kind of ground transmissions were in use in WW I. Separation of feedpoints was much more (100 - 200 m). With a 100 W audio power you could communicate perhaps up to 10 miles in rural areas where power line interferences are minimal. The same method were used also for listening to enemy's landline telephone communication especily if ground was used as "second wire". Gound currents are interesting in many ways.

6581. HF Skin Effect

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-10-24 18:20:50 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9r71mqbug7@neptunium.btinternet.com>
Source record: 49181

NOW AVAILABLE ** Small program "WIRESKIN.exe"

This simple program demonstrates the effects of the increasing resistance of copper conductors as frequency varies from DC up to 1GHz or more. As examples it computes performance of a straight round wire, an open-wire transmission line, of any sizes and dimensions, and a half-wave dipole. The effects of performance versus temperature are included.

See how fast the HF loss of balanced-pair lines increases as the wires get closer together and Zo decreases. Loss can be greater than coax.

Use the program to calculate the loss at speech frequencies of a 400-mile overhead phone line, London to Edinburgh.

Or of a twin 1" diameter, spaced 10 feet, 100 mile power transmission line at 60Hz. Did you know skin effect begins at power frequencies? Or compute loss of 100 feet of 75-ohm line at 21 MHz. Or calculate Q and bandwidth of a 1/2-wave dipole at 144 MHz. End-effect included.

As a sideline, convert kilometres to miles, mm to inches, or degrees Celsius to Fahrenheit. Or mm to AWG.

Only one file. 40 kilobytes. Not zipped up. Run immediately. Download WIRESKIN in a few seconds from site below.

Regards, Reg, G4FGQ

From: Jerry Frana <franaj@mail.coiinc.com>
Message-ID: <Pine.LNX.4.33.0110241328420.22318-100000@mail.coiinc.com>
Source record: 49180

Hi,
I am working on a project,
and it requires either a 2n1086 (or) 2n168a npn transistor...
are there any modern transistors that are equivalent to these?

Thanks
David F.

6583. Rec a small 70cm ATV Tx, or TX kit...

Can someone reccomend a 70cm ATV TX,TX kit or TX plans.....

Requirements:
As small as possible.
As light as possible.
Able to accept Audio input.
At least 1W output.

Paul (Kl7JG)

I prefer the North Country Radio kit. The mpx96 is all I've seen.
They have new mpx2000 that sounds pretty nice, but the extra stuff
doesn't seem worth the price to me.

One of the more famous such stations operates (or did) on 14 KHz with
multi-megawatts. The antenna was constructed of many thousands of feet of
wire running in a valley in the mountains somewhere in the Northwest.

Just wanted to say a big "thankyou" to all who had input into the Q-Dope matter. Everyones's contribution helped a great deal and I now have a virtually infinite supply and a whole bunch of new knowledge.

I'm even more pleased since I noticed the price of Q-Dope seems to have jumped a lot between recent paper catalogs and the same suppliers' online stores.

Cheers

I have a Pye PFX that I would like to get going on 70cms but it's hard to get hold of the Signets 82s129 Bipolar Proms, Also I would have to build a programmer for the Bipolar prom. I now that I will find it hard to fit a larger device in the PFX case but in true amateur spirit I thought of lashing up a EPROM that is installed into a socket on the front of the PFX case.

I have the pinouts of the 82s129 Prom and would like to know what EPROM (if any) I could use instead. I have programming equipment for 27c16,32,64,128,256 &512 also for the 24c16,32,128 etc..... Would this be as simple as just making an adapter from the 82s129 to a 24c16 for example.

Any help appreciated.

73 de Colin.

Who cares about the power (not even the law cares about power to the
antenna, they just care about field strength).

PLL synthesized is worth every penny for the stability alone.

>>They have new mpx2000 that sounds pretty nice, but the extra stuff

And your slug tuning tunes infinite. Who cares. 100KHz steps are
probably easier than switching .0/.2/.4/.6/.8 vs .1/.3/.5/.7/.9 .

And most people, myself included, think the mpx96 sounds better than
the ramsey FM10A.

Colin -

You can swap a 2716 or 2732 for the 82s129.

See Mike Blenderman's page for the how to as described in eeprom conversion.

http://www.open.org/~blenderm/syntorx/legacy.html

Or you can see what I have come up with for the Motorola Syntor

There's a nice book called "Real-World Interfacing With Your PC" that
discusses programming the parallel port.

Author: James "J.J." Barbarello
Prompt Publications
ISBN 0-7906-1078-7

It shows how to use basic, particularly Quick Basic, to control pins on
the paralle port. It ought to be able to do what you want, although I am
not certain how precisely you could set the width of the pulses.

There are DLL files on the internet that can give the same ability to
Visual Basic programs to access the pins for those who want to work in VB.

==========

NOTE:

These programs that directly access the parallel port pins will work in DOS, WIN95 and WIN98.

BUT... Win ME, NT, 2000, and XP all add a layer of code between the user and the parallel port that usually cause any program that tries to use the port for anything except printing to have real problems....

Looks like you could get a 2N1086 from www.acksupply.com, or the NTE replacement someone else mentioned. But if it were something I was doing, I'd convert over to a silicon transistor. I'd have to look at the circuit to be able to tell whether any additional changes were in order. Typically the key things that would be hard to replicate with a silicon transistor would be the B-E forward bias voltage and the B-E reverse breakdown voltage. There are a few other things that might cause trouble. But if the circuit doesn't stress the reverse voltage of the B-E junction and uses a good biasing scheme to make it insensitive to that transistor characteristic, it may be possible to simply put in a 2N2222 or 2N3904 or the like, with no additional changes. (I'm remembering the '168 as a small signal transistor, not a power transistor...please forgive me if I'm off-base on that.)

Cheers,
Tom

Source record: 49103

I am using a Yaesu FT-290r rig with it's supplied YM-47 microphone. However, today the element in the mic appears to have died. I didn't have any other elements lying around that I could take out of other mics so I decided to use a small electret element that I bought a while ago. Included in the packaging were hookup instructions for this element, a 10k resistor, and a 3.3uF electrolytic capacitor. I followed the instructions connecting the 10k resistor and the capacitor(+ end) to the output of the element and then a ground connection for the grounded side of the mic as well as an the "hot" connection for the element. But when I hooked the mic back up it started changing frequencies without me pushing the buttons on the top. I disabled one of the buttons and turned the lock on for this feature but that didn't help. Does anyone know if I did this correctly? Is there another way to do this that I missed? Any help is appreciated as I am without a radio right now. Thanks!!!!

The primary winding will have a higher dc resistance than the secondary winding...so a quick check with a meter will tell you which is which. The red dot is sometimes used to mark the start of the winding.

regards
Alastair

PC Electronics makes an ATV transmitter board that does 1 watt.
Rugged, too. It survived a RC plane crash. It runs off of 12 volts.
I use an Embedded Research EPS-1 step-up switching supply to
run it off of batteries.

Don't remember the model number, check their web site.

<snip>

Worst case: If you decide not to convert to an EPROM, I believe I
still have a tube-full of new 82S129's, and I've also got a programmer
that can manage them. I would just need the binary file to program in.

This is something I do as part of my side business. If you decide
you want me to program something for you, just let me know and I'll do a
special quote (since it's for hamateur purposes).

I recall, I think it was a UK radio amateur website, that described sending audio through the ground. In other words the output of an amplifier at several watts (maybe 30 to 50?) was introduced into the ground and experiments were made to see how far the audio would be detectable. Can't remember details. but do seem to remember that in one instance a 'sea ground/earth' was used as one electrode?
Thought I had noted the site within the last 18 months, but since then computer crashed and has also been replaced and I couldn't find bookmark! Terry.

Will, IIRC, "Whistlers" were discovered this way. During WW I, it was common for battlefield commanders to communicate with each other by telephone and telegraph. Because of the cost of stringing copper wire, these signals were often sent over one wire and the other side grounded.

So someone figured that if they could spread two grounds far enough apart and feed them to this revolutionary thing called an audio amplifier, they ought to be able to intercept the landline communications.

It worked, but they also heard something else: Whistlers. They had discovered what some today call "natural radio". This is basically the earth's magnetosphere, ringing back and forth from solar wind, thunderstorms, meteors and other such phenomena.

So, the answer to your question is yes, you can set up electromagnetic waves at audio frequencies, but be aware that you won't have the only signal on the air...

Well now that i have built an osilator that i can use with my world radio to rx cw and ssb i need to build a squelch of some type into the radio.... even building some form of squelch that hooks to the earphone jack based on the audio level would be good anyone have any suggestions?? I ws thinking something that either would trigger off the rf signal strength or audio level... I just don't care for the static all the time..

Sorry to tell you this, but squelch isn't going to help much.

The weak signal modes don't rx like FM. In FM, once you have the modulated carrier, you can detect the audio with minimal distortion and static, as the nature of static and the nature of FM are quite different. CW and SSB, however, are quite prone to static. On my Kenwood TS-830S, static doesn't blank out until the rx signal is at least 3 S-units (possibly even 5) over and above the band noise.

The best way to get rid of the static is to turn your RF gain down until the static is inaudible, then turn your AF gain up until you can comfortably hear the incoming signal. Be careful, though, if you are listening to an S3 signal with S2 band noise---if someone drops in at S9, your eardrums probably won't survive the blast.

Good luck,

Hello,

PC 900 is a B7G base triode with a heater of 3.9V 0.3A, Va is 135V
Vg -1V Ia=11mA Wa 2.2W Ik=20mA max, u=76 and the gm is 14.5mA/V
A very promising valve to experiment with in low-level stages, both
audio and HF/VHF amplification. It was developed for use in VHF and
UHF television tuners.
I have 400 pcs in stock and the price is only $ 3.00 each or $ 1.50
each if you buy 100 pcs or more. The valves are NOS, in mint
condition, original boxes and the label is Haltron, but they are
rebranded, and I think the are originally made by Philips or Siemens.
E-mail me if interested.

Best regards,

Arnold Goks yr

So you need a comparator with a little bit of hysterisis (i.e. an integrator). You set a level above which the comparator goes "on" and switches a transistor which feeds you phones.

Squelches as others have pointed out are just comparator circuits, using op amps with hysteris. Most rely on detecting a voltage which works nicely for constant carrier modes. When it comes to voice and music its a different ball game all together. Most of the commercial high grade receivers use what they call a "sylabic squelch" which can reliably detect voice and music and open the squelch. There has been some practical circuits published by Ulrich Rohde in QST using analogue techniques. Most sylabic squelches are now being implamented using DSP techniques.The European receiver manufacturers are the leaders in this area. One you have tried a Rohde receiver you will be a convert.

Dont expect much from the Japanes ham manufatcurers, they really in the stone age when it comes to state of the art communications techniques. An example of this is their inability to deliver high performance receiver numbers with hight intercept points. Other simpleton things like a calibrated S meter even seems to delude them, and this is on DSP radios. So if you want to seek out the state of the art, look at Rodhe, Racal and Kneisner Doring for state of the sylabic squelches. At the current rat of progress from the japs, expect a sylabic squelch in 20 years times.

Willy

I am in need of dial scales for 8620 sweep generator...specifically I need ones to go with the 86240A, 2.0-8.4 GHz (scales would be full-band 2.0-8.4, 1.8-4.2, 4-6 and 6-8.4 GHz).

If you have spare scales for almost any band I could use them in a pinch and make overlays.

Thanks in advance.

6625. return/chassis connection question

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-10-27 14:17:12 UTC
From: Richard Daventry <newsgps_email@ntlworld.com>
Message-ID: <bizC7.3948$GA.441186@news2-win.server.ntlworld.com>
Source record: 49129

Admiralty Murphy B40 RX. Three seperable units RF, IF, AF & PSU. RF chassis is pretty much permanently bolted down. IF and AF & PSU can be removed. Normally, all units electrically connected by their mechanical fitting together. Okay, AF & PSU and IF chassis are connected (via plug and socket) by a wire. Current returns for circuits in these chassis must go through mechanical connection of chassis as well as the wire connecting both the chassis. Center-tap of power tfmr secondary connected to AF & PSU chassis.

RF chassis as I say bolted down. No wire connection between RF chassis and AF & PSU chassis. Now, it must be that returns from RF circuits soley go trough mechanical connections to the AF & PSU.

Okay here's the funny (to me) bit. In AF & PSU chassis, HT smoothing choke feeds a (gas type) regulator, but the cathode does not go to chassis. It connects, via a wire (via plug and socket), to the RF chassis. Regulator feeds to Local Osc. Can anybody tell me why the stabilizer cathode does not go the AF & PSU chassis, and why it would be connected the the RF chassis? Thanks.

```

Should be:

```
RF PSU & AF Wire to Cathode of voltage reg
-------->o___________o< _______
|
\\\
```

Clarification: RF chassis connects by wire to stabilizer cathode only.
Cathode does not get wired to PSU & AF chassis.

Okay, I got directed to a schematic on a web page.

Please go to:

http://website.lineone.net/~adrian.j.reynolds/schem3.jpg

See V304, stabilizer. Cathode goes to what looks like chassis, that solid line is not the AF & PSU chassis. In fact, cathode connects to RF chassis via wire. So cathode is "earthed" in the RF chassis.

I'm puzzled.

A poster (In another NG) has responded telling me it is the output filter in a capacitor-input power supply. Apparantly, I do not need to place another 4uF cap to decouple AF amp, if I build the AF amp on a seperate AF chassis. C305 therefore goes with PU.

Bought Telefunken E381S receiver last week-end, it is a marine receiver dated 1932. Only simplified circuit diagram is available, but it doesn't show several components, and information about where tubes are placed is also missed

Does somebody have any information for this 70 year old receiver? It uses 4V direct heated tubes, RES094 RF tetrode, and 3x RE074 triodes. RES094 is similar to 36 but anode is connected to top-hat

All I can say is this:

Return currents from cathodes of tubes in RF chassis return to PSU secondary center-tap by way mechanical bonding between RF and AF & PSU chassis. There is no return wire for these currents. Local Osc anode voltage is taken from stabilizer, but return current for L.O. returns in the same way as all the other tube cathode currents in RF chassis. The wire connecting the stabilizer cathode to RF chassis only takes current passing through the stabilzer, it does not pass any returning current from any of the tubes in the RF chassis.

Which still leaves me puzzled as to why the stabilzer is not grounded on the AF & PSU chassis. Like some have said, possible grounding current problems made designer ground the stabilizer cathode as he did. It's just that I cannot see the current problem.

Two things:

It might help to not regard the chassis or chasses of the system as "ground." That connotes a monolithic entity that is all powerful in sinking all unwanted currents and signals. What most actual physical systems consist of, especially when physically built on different chasses, etc., is a group of circuits interacting with one another and exchanging current by a variety of paths. The issue is greatly confused by thinking that "ground" on one chassis is "ground" on another, even if the two appear to be connected. The properties of such connections vary widely with several factors, not the least of which is frequency. Size plays a big role as well.

The second point is that return currents among circuits commonly take paths that may not be represented on a circuit diagram. Because of that, it is many times difficult to look at a circuit and understand a "ground loop" problem, because the circuit and its properties may not be very obvious from the diagram.

In the end, some engineer finally "got the thing to work fairly reliably" with the "ground/return" configuration that you described. It probably makes no sense in terms of the circuit diagram. And with all respect, I doubt that the engineer really understood it either.

Such is life in the trenches of engineering . . .

That's great, just the info I was looking for......I have decided to make a adaptor for the PFX. The ones in the links are similar to what I'm going to build. The only problem being that inside the PFX there is little room, but I'm sure I can squeeze one in somewhere.

Thanks also to Bruce for the offer of programming a 82s129 PROM. However I fancy making an adaptor similar to those on the links that Andy and Lion sent.

Thanks again all.

Regards Colin.

Exactly.

I've taken the RX to bits and noted the actual wiring. When I rebuild in an entirely new cabinet and chassis sections, perhaps it will make sense to keep to the way the original designer arranged cathode returns, then again maybe that is unecessary, I don't know. I find that cathodes for V301 (1st AF amp) and V304 (stabilizer) do not connect to the chassis they are situate. Stabilizer bonds to the RF chassis by a longish wire and 1st AF amp gets bonded to IF chassis again, by a longish via a wire, though I see multiple chassis connections associated with 1st AF amp cathode as it's part of LT heater line (bonds adjacent to tubes as usual). 1st AF amp does not, in any case, bond in AF & PSU chassis though where it is situate. I also see that IF tube cathodes connect to 1st AF amp cathode return circuit rather than getting bonded directly to IF chassis, though bonding eventaually occurs on the IF chassis. There must be reasons for these arrangements as has been mentioned. As you say, it could be difficult to figure out exactly how these arrangements were arrived at. Maybe they come in if chassis sections removed from main cabinet when servicing. Designer probably long dead by now as it's a 50's set. Royal Navy peice of gear. Built like a battleship. :c)

Anyhow, thanks for your comments.

Rich.

> I'm curious, does anybody know of a good site online (or book
> wise), with software/design specs for a "simple" 914.5MHz PCB
> loop antenna?
==========
You may find it faster to experiment and design your own circuit
rather than trying to fathom out what some published academic,
poorly presented, unreliable formulae are all about..

Dimensions depends much on very local component environment.
Use UHF low-loss material for PCB.
ESSENTIAL - NO groundplane on other side of PCB.
Isolate the loop in space as far as possible.
Use a circular, hexagonal or square track for the loop.
Area enclosed by loop is what matters most.
Prefer a circular for greateat efficiency. But it's not critical.
Use ONLY ONE TURN in the loop. More is disastrous.
Use a broad track for low track loss. Say 1/8th loop diameter.
A broad track width makes for greater bandwidth.
The LARGER the enclosed loop area the greater the efficiency.
Keep away from other metallic components and lossy materials.

Basic design is a tuned loop with a smaller coupling loop to the
transceiver inside it. Isolate the main loop with its preset
tuning capacitor from any other parts of the circuit. Locate the
coupling loop nearer to the side of the main loop opposite the
tuning capacitor but it's not critical.

Download in a few seconds program MAGLOOP4 from website below.
This program is primarily intended for HF applications. To
translate to UHF, design an antenna for 9.145 MHz and divide all
linear dimensions by 100. Divide the computed value of tuning
capacitor by 100.

Assume the equivalent diameter of a circular loop conductor (as
required by the program) is exactly half the width of a thin, flat
PCB track. The diameter of the coupling loop depends on the load
to be presented to a transmitter or to the input resistance of a
receiver. Coupling loop diameter (a transformer winding) is
proportional as usual to squareroot of load resistance.

An unknown factor is the permittivity of the PCB material. This
will have the effect of considerably reducing the value of the PCB
tuning capacitor. But as this component is to be preset anyway this
should not be a problem. If the equipment is eventually to be
produced in quatity then a built-in fixed PCB capacitor should be
considered. The dimensions of such a PCB capacitance can be

determined ONLY by experiment and measurements of the loop's resonant frequency.

Experiment :- Produce a loop on a PCB + some form of tuning capacitor. Measure its resonant frequency. To bring exactly to tune on 914.5 MHz remember frequency is inversely proportional to ALL linear dimensions, including dimensions of the capacitor, simultaneously.

Download MAGLOOP4 from URL below. RJELOOP3, an earlier program for non-extreme rectangular loops, may be of interest.

Thanks Grumpy. I believe I specified TINPLATE not ALUMINIUM,
(screening properties are somewhat different).
However I will look and see if they have improved their stock,
miracles do, occasionally, happen ;-)

6660. Zero crossing detector

Source record: 49010

Hello All.

I have a Icon IC-251A (144 Allmode)
and a Icom IC-451A (430 Allmode)

I'm not sure if it can be done but on the back of the radios
there is a 24 pin molex female connector (.032 Pins ?)
that have some of the data/controll/audio Sigs present)

Is there a design for a interface that i can build
that will allow me to slave the two radios togather for Sat
Operation ?... I've searched the net with no luck so far

Thanks for the help in advance

Source record: 49015

Perhaps if you look into comparators?? If one input of a comparator
is grounded and the other is the signal input, the output changes
state at the zero crossings (plus a propagation delay). How were you
then going to demodulate the FM? If you do it at a low enough
frequency, you can simply feed the digital wave to a one-shot and
average the output, though that probably isn't the best of FM
detectors. Better s/n ratio
if the percentage deviation is high (that is, if the IF freq
is low). Theoretically perfectly linear, though difficult
to make the oneshot period totally independent of frequency.

Cheers,
Tom

6677. Wanted: small HV power transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-10-30 14:19:51 UTC
From: k5dh@raytheon.com
Message-ID: <bGyD7.4$284.95@dfw-service2.ext.raytheon.com>
Source record: 49023
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Greetings, tube-gear fans...

I'm looking for a small HV power transformer:

Primary: 110 VAC

Secondary: 300 to 350 VAC center-tapped at 50 to 100 mA
--- OR ---
150 to 180 VAC without C.T. at 50 to 100 mA

Filament: 6.3 VAC at 2 to 3 A
--- OR ---
12.6 VAC center-tapped at 2 to 3 A

Size: No more than 2-1/2" W x 3" D x 3" H

The application is for the power supply in a homebrew 80m
and 40m tube-type VFO. After full-wave rectification and
some stiff filtering, I want to wind up with +200 to +250
VDC for the cathode follower and post-amp plate voltages,
and I'll use a VR tube to regulate the oscillator plate
voltage. I am very constrained on space in the cabinet
(which is why I specified that small of a physical size).
Anyone have something in that range that they can sell me?
Yes, I'm aware that Antique Electronic Supply and other
dealers sell new power transformers, but their cost is
astronomical. I'm trying to do this "on the cheap" with
all junkbox parts.

73,
Dean, K5DH

Dean,

You should be able to get 300V @ 100mA using a half wave voltage doubler and use a separate filament transformer. I'm not sure if you can fit it in your space, but breaking it up into two devices may help. The cost will probably be less, too. A couple of 150 uF@450V , a couple of diodes, a surge resistor, and a few bleeder resistors should do the trick.

I recently did this for a German tabletop radio I had bought with the transformer missing and it cost less than $15 including a Radio Shack pc board.

Consult most any electronics book or the Radio Amateur Handbook for a schematic, or email me and I'll send one along to you.

Good luck.

Your best bet is to buy them from Eisch Electronic in Germany. They have a very efficient mail order service, to all parts of the world, which I have used several times.

I deleted your original posting so cant remember what size box you wanted. Their latest catalogue shows a wide range of tinplate boxes in two depth sizes, 30mm and 50mm. The smallest box is 37mm x 37mm by 30mm deep and is priced at 2.90DM (less than a quid, which = 3.1=DM these days). The 50mm deep version is 3.60DM. They give a discount of 5% for orders of ten to 49 and 15% off for orders of 50 to 99, etc etc.

The next box size is 37x 74mm, also in the two depths shown above, There are 14 different sizes, up to 102mm x 162mm x 50mm and that one is 13DM per unit.

The prices include EU VAT but not postage.

If you email them in English with your requirements you should get a speedy reply, also in English! Their catalogue however is in German.

Their email address: mailto:eisch-electronic@t-online.de.
They have a website at: www.eisch-electronic.com

There was a UK source a few years ago but he was SOOOoooo sloooow in delivering them!

For microwave parts, high quality xtals, etc and other stuff you cant beat Eisch for service.

(ps I dont have any financial connection with the firm!)

I would have banked 9 2.3V gel cels, which I have seen at All
Electronics.

> I need to fabricate a 18V gel cell battery charger.

Check the May 2001 QST. All you'll need to do is modify the voltage
such that the bulk charge can happen. Also make sure to modify the peak
current output to bulk charge rate for your cells (about 20% of the
rated AH capacity). This article is available for download from

The power you want to handle is, approx.
Hi Voltage: 15 to 35 watts.
Filaments: 13 to 25 watts.
Total: 30 to 60 watts. First transformer.
Hi Voltage: 15 to 35 watts. Second transformer.
Was going to suggest two 110 volt filament transformers back to back.
Heaters off the intermediate connection at 6.3 or 12.6. Voltage double
from the output (primary), now the secondary of the second transformer.
115 x 2 = (roughly) 230 volts and filter it. The two separate
transformers might be easier to fit in available space.
Just an idea.

Hi Guys;
I have only had a few queries but no takers so I've decided to make the price more tempting :-)
This rig is very much restorable if not for the parts alone!
Remember the price is PPD!
Tr-4C technicians special or parts.
it is complete except:
1- 1ea tubes are missing, 6AQ5, 6EJ7, 12AX7
2- the Larger of the two relays that are under the chassis is missing!
3- there are 5 xtal sockets right under the meters, only 2 xtals are present, the 35.5 & the 21.5, I think originally there were 4 or 5!
4- Most original cabinet screws are missing but enough to hold it together.
5- The top cover is "crumpled" right at the front, on top. The bottom is fine, all correct plastic feet.
6- Back has Vibro identification, seen in picture.
7- Front Panel is Excellent Plus!
Check the pictures please as I am selling this for Repair or Parts.
Well worth it in parts alone for $115.00 ppd Conus!

I modeled a switching supply which should be easy to build. Take a look at the application notes for the LM3524 pulse width modulator on the Nat Semi webiste (the "step up" configuration). You would 1/2 wave rectify the HV output of the existing transformer, and feed this as the DC input to the choke. A HexFET could be used to pump the inductor. I used a 10kHz frequency and 30% duty cycle and the output was a neat 200VDC. The inductor is 1mH and filter capacitor 200uF. You could fit all the above into about 1/2 the space of a 5U4G. The LM3524 will operate from a single supply which you should be able to pull off pretty easily. The low switching frequency means that you won't generate a lot of QRM.

Just took the T.I. C6711 DSP Starter Kit Class Tuesday.
Class costs $349 with the 150Mhz DSP Starter kit. The
kit alone is $299.
See;
http://www.ti.com/sc/docs/training/training.htm

I'm researching direct RF processing up to 30Mhz and higher,
but depends on the A/D I can come up with. Starter kit has
plugin connectors for external A/D. Currently only comes
with an audio Codec chip with 8khz sampling. I saw somewhere
a 24bit 600Mhz A/D with 115db dynamic range but misplaced
the bookmark. Sure hope to find that one again.

I am wondering how you folks who have tried one feel. I had one contact with a fellow who was using the 20mtr rai-beam, and I was impressed at his signal level compared to others near him that I QSO'd with the same morning. I was all set to purchase a beam of my own, until I saw the price. Over $300 for a single band unit. Yikes. Do you folks feel it has 'bang for the buck' or should I just buy something more conventional, and at about 1/3 the cost?

Message-ID: <01c162b2$a1c00020$c631b8a1@cwsouth>
Source record: 49052

Hi all;
For purely antiquarian purposes, I am building an older style crystal detector for my set.

Does any one have a picture such a detector or diagram of how to attach an electrode to the PbS (galena) slice?

I was looking to use silver epoxy to attach a wire, then mount the crystal in a brass mount.
I could plate a copper one on. Not sure.

The whisker is made from some stainless steel spring wire hooked to a brass binding post.
(Trying to find some old 78 needles has been a bust.)

thanks in advance. "73"

All I've ever owned were "embedded" in a metal which looks/feels/scratches
like lead. Then a spring-clip holds the lead chunk still so the "feeler"
can probe around on the crystal.

Source record: 49055

Hi,

If you want to do it yourself here's more or less what you do.

Most home made holders had three or four brass screws coming in from the sides of a brass ring. They would clamp the crystal more or less in the center of the ring. Galena isn't all that tough so getting the right amount of clamp pressure is a matter of trial and error. It's a good idea to have some extra on hand before you start.

The probe whisker needs to be fairly sharp. You also need a reasonable way to adjust pressure. The traditional way was by bending the spring. You don't need a lot of pressure so a massive spring is not required.

What you are trying to do is create a small p-n junction at the point of the whisker. To little pressure and you have no real contact to the region. To much pressure and the crystal fragments rather than goes into p-n mode. A low current / low voltage ohm meter might be a handy tool to have around as you practice getting it right. You want one that puts out something like 200 mv or so and has a 10 Meg ohm scale.

On the clamp side you want to be sure you do not have a semiconductor. Again the ohm meter would be a nice tool to help figure out if you have it right.

Of course there's the time honored method of just fiddling with it until it works or you give up.

Hope that helps

Hi all;
For purely antiquarian purposes, I am building an older style crystal detector for my set.

Does any one have a picture such a detector or diagram of how to attach an electrode to the PbS (galena) slice?

I was looking to use silver epoxy to attach a wire, then mount the crystal in a brass mount.
I could plate a copper one on. Not sure.

The whisker is made from some stainless steel spring wire hooked to a brass binding post. (Trying to find some old 78 needles has been a bust.)

thanks in advance. "73"

I found a place on the net that sells 78 rpm needles (I needed some for my
78 RPM wind-up). Can't remember where it was but search on victrola needls
or record needles or something like that. You'll find it.

Hi Clark,
The following books all have info on xtal detector construction:

1. High Power Wireless Equipment - Articles from Practical Electricity
1910-11
2. The Very Best From The Electrical Experimenter 1916-1917

both above reprinted by Lindsay Publications Inc.

3. Early Radio Wave Detectors V J Phillips Publ. Peter Peregrinus Ltd 1980
ISBN: 0 906048 24 9
(and you just wouldn't believe some of the detectors described in here - how
about wires connected to your teeth & detection by taste changes ..... !!!!)

Another of those useless facts that get in the brain & stay there is something
I saw once about how the very fine point on a cat's whisker wire can be
made by using the wire as a terminal in a crude electrolysis cell. Can't
remember any more but someone else might - Scientific American Amateur
Scientist article ????

OK. I am back. Received your post and wondered if you
needed a half-dozen 78rpm needles (used) no charge. I also have some
packages new, and for the benefit of anyone else reading, 4 detector
assemblies complete with crystals, and 4 factory built coils with sliders.
VE7AFN/M.

Source record: 49059

when i was a kid a long LONG time ago, we used a circle cut off of a piece of coper pipe. take 1 inch length of 3/4 pipe and cut several cuts 1/2 inch deep into one end. two mounting lugs were bent out from the cut sections to provide secure mounting. the other sections were bent in to provide a bottom. this leaves you with a 1/2 inch tall copper cup with two lugs bent out at the bottom. grind your galena to fit with space all around and a groove to provide a secure hold. heat everything with a torch and fill with solder to the top, leaving the top of the galena sticking out.
the cats whisker is a diaper pin (remember those?). works great.

I have a "Lewis and Kaufman" JAN-CBOP-250TL
tube ,
I tried the search engines to see If I could find the specs on this
tube, like heater voltage &amp ,max plate voltage ,plate dissipation
etc.
to no avail ,if you have any old charts that give the specs , I
would appreciate it
if you post it here ,
Its still in this metal cage thingy , the tube is supported by 8 springs , I
guess the box it came in detoriated
Thanks

One third the cost? Where??

That would seem to imply that you have a source for monoband beams for $100. I don't know of any, and certainly not for 20 meters. You could probably buy a CB beam for that price and adjust it for 10 or 12 meters, but I don't even know of any beam actually manufactured for 10 meter use that you can buy for $100.

Looking for a helpful ham willing to help out
the "soldering iron challenged"...I'd like to
experiment with the AMRAD Active Antenna
featured in the September 2001 issue of
QST magazine, (Page 31) but just don't have
the time, skills, or patience to complete the
circuit.

If you'd be willing to construct the circuit, complete
with the interior enclosure, etc...I'd be happy to
pay for parts, labor, and aggravation!

If you're interested in this project, please contact
me via e-mail as I only rarely check this group.
Serious inquiries only please...thanks and
73...

Hello all,

Do any of you homebrewers ever find time to transmit? We have a
very active homebrew net here (Western Europe) on 3.727MHz. It would
be nice to work some homebrewers from other parts of the world.

Propagation has been really good on 10M lately. If anybody would
like to attempt a contact, I will be listening on 28.985MHz for
most of tomorrow afternoon. From about 15:00 UTC/GMT onwards....
Oops! I should mention that tomorrow is Sunday 4th Nov. 2001.

Send an e-mail if you want to make a SKED. Remove the X from
in front of my reply address.

Source record: 49076

The Galena ore is normally mounted in a slug of Wood's Metal, which has a melting point below that of boiling water. Trick melting spoons were made of the same material and sold by gag shops many years ago. You can buy mounted galena ore from vendors, or you can fashion a simple clamp to hold the ore.

Don't use something sharp and stiff like a phono needle to probe the ore, that is fine for silicon detectors. Galena is soft, and you will quickly ruin the sensitive spots with something that hard. Look for some fine brass wire and make a pig take arrangement for probing the surface. Many hardware stores sell a fine brass wire for hanging pictures that is ideal for the purpose. You may have to clean the galena with some pure alcohol, if the sample is old, to remove oxidation before it will work.

I want to build a device that will enable me to combine inputs from a 2m and a 70cm antenna into the one BNC connection on my HT. I believe this would be a duplexer?

no, its an antenna coupler

probably consisting of two band-pass filters to a common connector

a 'duplexer' permits simultaneous transmit and receive on one antenna

a 'diplexer' combines two transmitters into a common antenna

whereas you simply want to couple two antennas into one HT, but will be
using only one frequency (or one band, anyway) at a time

The Galena ore is normally mounted in a slug of Wood's Metal, which has a melting point below that of boiling water. Trick melting spoons were made of the same material and sold by gag shops many years ago. You can buy mounted galena ore from vendors, or you can fashion a simple clamp to hold the ore. Don't use something sharp and stiff like a phono needle to probe the ore, that is fine for silicon detectors. Galena is soft, and you will quickly ruin the sensitive spots with something that hard. Look for some fine brass wire and make a pig take arrangement for probing the surface. Many hardware stores sell a fine brass wire for hanging pictures that is ideal for the purpose. You may have to clean the galena with some pure alcohol, if the sample is old, to remove oxidation before it will work.

Hi all;
For purely antiquarian purposes, I am building an older style crystal detector for my set.

Does any one have a picture such a detector or diagram of how to attach an electrode to the PbS (galena) slice?

I was looking to use silver epoxy to attach a wire, then mount the crystal in a brass mount.
I could plate a copper one on. Not sure.

The whisker is made from some stainless steel spring wire hooked to a brass binding post.
(Trying to find some old 78 needles has been a bust.)

thanks in advance. "73"

I agree, taking on a TRX as a first project is likely to end in tears.

Kits are probably best to start with. However, if you are set on 100%
homebrew, how about trying a simple 6m direct conversion RX for
starters. Or maybe something down in low HF (say 80m) where things are
cheaper and less critical?

I think making an RX first is important. Most people consider RXs to
be fundamentally hard, much more so than TX. This isn't really true,
while making an outstanding RX is hard, making one that mearly works
well is quite easy.

Getting a few RXs under your belt helps build up your confidence. RX
are also fairly instant gratification, a TX is useless if you are deaf.
If you build them right you can build a matching TX later using the same
LO.

Just my 2c anyway.

The 302 has very low bandwidth, so I suspect you cannot use it for
listening to radio signals, believe we used it for measuring
24/32channel telex and alarm systems on telephone lines where the
shift is only 60Hz and it was important to see the difference between
MARK and SPACE, didin't use it much because we had a Walter&Goltermann
SPM-1 with MARK/SPACE frequencies for the different channels marked on
the scale

it....can
> any one point me in the right direction...?
==========
On the assumption that 'walkman' style headphones have an impedence
(usually valid for 1000 Hz) of approx 32 Ohms and a receiver requiring Hi Z
phones prefers to see approx 2000 Ohms ,
,you would need an impedence transformer of 32 to 2000 Ohms or about .
The transformer for this job with windings n1 and n2 would need to have a
winding ratio n1/n2 ,whereby n1/n2 = sqrt 32 / sqr 2000 = 0.126 or
n2/n1=7.9 say 8

It means the high impedence side of the transformer is to have about 8 times
as many windings as the low impedence side.

Since this is not a HI-FI job you can try a small power transformer say 115
/ 15 or any small transformer with a winding ratio of this order of
magnitude ,it's not all that critical .
Perhaps you find some small transformers in an old transistor radio . Or
even a small loudspeaker transformer from an old valve BC radio .
To check the winding ratio of an unknown transformer , put 1 V, 50 or 60Hz
(from another transformer with the primary connected to a Variac if
necessary) and check the output of the other winding ....Use a digital
AC voltmeter.

This is not Hi-Tech stuff ,but the method can give you an acceptable
impedence transformer for a simple non critical application.

Good Luck

> to generate about 100w from a 4w input....uses a EL519 Final tube
==========
The EL519 is a TV sweep tube with 6.3 V filament voltage . Even better known
is the PL519 ,filament current 200 mA (approx 40 V)
It is similar to the 6KD6 valve found in various Yaesu transceivers from the
1960s

Although 100 Watts output for 1 valve is possible (with very good cooling)
,it is better to put 2 in parallel,
operating them with no more than 600 V on the anodes. In this way you get a
good 'Ham life' out of these valves.
Apart from the Yaesu radios ,eg FT-200 /-400/-401 etc. there are a number
of homebrew designs by PA0FRI using these valves , published in Electron
(VERON -Netherlands) and also in Radcom (RSGB- UK)

I picked up a box of Ham radio gear at a estate sale (old friend), felt sorry for the widow, you know.

I'm not a Ham but thinking about it some since I was a kid.

Anyway what I got was a AEA CP-1 set up for a Commodore 64 and a Heathkit HD3006 Crossfire Scope.

Now I know technology has advanced and the Commodore has been replaced with PCs..

Do I have anything here worth messing around with if I just want to DX CW and RTTY. I did a Google on the CP-1 and no one has discussed it since 1997. It seems to use it with a PC, I have to do so some wiring tricks with the RS232 cable coming out of the CP-1 and I need some software.

Does anyone have any recommendation on public domain software and the wiring changes for the RS232 cable.

Or should I just salvage the cables and start thinking about Pactor (someday).

Thanks

Steve

Source record: 48953

I used to own a 302A and used it from time to time. It covered up to 16 kHz I believe (well, 16 kc as they said then). It was large and the setup procedure a bit of a pain but it did the job. Never had a problem with it.

I used it for measuring hum content, amplifier gain (while ignoring distortion) and such. One could make a nice measurement to see how much distortion was even and how much was odd. And as a voltmeter it was accurate enough for nearly any use.

The ones I've seen have been dirt-simple audio mixers with either simple resistive mixing or "virtual ground" current summing mixing (a fancy term but trivial to do with most any op-amp). You can probably draw the schematic from scratch and end up with something as good as any of those published ones.

Thanks Ralph, I have the manual and the schematic for the CP-1 and you are correct about the optional RS-232 port on the CP-1. The it takes a couple common chips and the connector to bring the unit up to RS-232 capability. I could easily do that upgrade if I find this old unit worth while at all.

I guess I'm an "ole sucker" for obsolete technology. I hate to throw it away. I'm almost tempted to dig up an old Commadore 64 just so I can play with it. At least I have the software cartriges for that computer. (Just kidding.)

If anyone knows of a DOS or Windows shareware (freeware) that is still available for this equipment I would appreciate it.

Thanks

Steve

I don't know if there are any on the web. The
'ARRL Electronics Data Book' has some good information
about baluns. If you don't have access to a copy,
send me an e-mail and we will arrange a minor
infringement of the copyright laws. Don't forget
to remove the X from my address.

The cp-1 was just a demodulator unit. The output was just a simple conversion of the audio tones to whatever the Commodore used or some versions had a rs-232 connector that could be plugged into a computer serial port and would put out a + and - voltage as the tones changed from mark to space. If you have the serial port installed in the cp-1 then you may be in good shape. All you need to do is find some old softwear to use it. It may take a long time to find any as most of it was written for old DOS computers. If the cp-1 does not have the serial interface for the IBM/MSDOS type computers it may be some problem to make it work unless you can find a schematic of the cp-1 and install the parts .

YOu may be beter off going here:

http://www.muenster.de/%7Ewelp/sb.htm

and looking at some of the sound card programs. The one called something like mmtty is very good for rtty.

I disagree with those who would suggest that you buy a rig,
convert a CB or buy a kit. If you would prefer to build
your own rig, I think you should be encouraged to do so.
However, as several others have pointed out, building a complete
transceiver is not a trivial project.

You won't be able to transmit until you get your ticket so
you might as well start with a receiver. A high performance
receiver for 6M is a challenging project for a beginner. If
you have a HF (short-wave) receiver, either homebrew or
commercially made, a 6M to HF receive converter would be
a lot easier to build.

Have a look at the receive section of my homebrew transverter:
http://homepage.eircom.net/~ei9gq/50conv.html

Good luck with your homebrewing.

6767. SWR due to coax switches

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-05 14:54:35 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9s69li$a2s$2@plutonium.btinternet.com>
Source record: 48961

Reflections from impedance mismatches at switches in coax feedlines are often mentioned on these walls and described as something which matters. But nobody ever says how much it matters. Very often it doesn't. Home-brew coax switch makers may be interested in the following.

Inside the switch box, as the inner coaxial conductor continues through the switch wiring it is defficient of capacitance. The inside walls of the box become the outer conductor of a short, much higher impedance line. The missing capacitance is proportional to the length of bare wire inside the switch. In the worst case the missing capacitance is equal to the capacitance of the same length of coax.

Insofar as reflections are concerned the missing capacitance has exactly the same effect as an excess of capacitance of the same value. It is a straightforward matter to calculate the SWR which results from a lump of capacitance across a transmission line. Furthermore we are interested only in small SWRs and the calculation for solid polyethylene coax then simplifies to -

SWR = 1 + F * L / 1250

where F is MHz and L is length of bare wire through the switch in inches.

At 144 MHz and a bare wire length of 2 inches, SWR is approx 1.23 which might not be considered excessive. Remember it is worst-case. It could be reduced by a small fixed capacitor across the line inside the box. (1.5" length of line ?)

Reflections below 50 MHz due to coaxial switches are entirely negligible in comparison with other causes of SWR > 1:1

A more accurate worst-case formula which applies when bare wire length is less than a very unlikely 1/10th wavelength is -

SWR = (1 + x) / (1 - x)

Where x = F * L / 2500

The formula can be used in other situations (a dummy load resistor ?) where a wire replaces a short length of solid Pe coax of any normal impedance.

I have received my shipful (actually a few truckloads) of 7 Amp-Hour POWER STATION gel cell batteries with wall charger and car charger as described at http://www.hamcontact.com/products.html . These are the units that I have been advertising in QST, CQ, etc., for years and are excellent for powering the new Yaesu FT-817, Icom IC706, etc. I am offering them at $39.95 plus shipping. This is $20 below the price that the major ham radio stores offer. You'd be paying 50% more if you bought from them. This is a once in a long while offer, and will be valid only until the end of this month (Makes a great Christmas present).

If interested either call 800-933-4264 or order via our secure website at www.HamContact.com

YOU MUST MENTION THAT YOU SAW THE REC.RADIO.SWAP LISTING TO GET THIS SPECIAL PRICING.

Thank you and please pass this message to a friend who might be interested,

Joe N6YYO
THE HAM CONTACT.

p.s. We also have larger 17 Amp-Hr gel cell "Jump Start" systems, Solar Panels and DC to AC inverters from 140 to 3000 Watts in addition to our radio amateur gear (no radios).

Typical amplifiers sold in the 1960's and 1970's really for the CB market, but
marketed "under the disguise" that it is for amateur radio (10 meter band).
Be advised that these are not amateur type accepted amplifiers.

The dead give-away is the 5 watt input. Many early versions used old TV
"sweep tubes" for the finals and were of questionably spectral purity. They did not call
these TVI or RFI monsters for nothing. Be especially cautious of any units that have
been tampered with the "urban legend" to remove the band filtering for more power.
More power everywhere, except where you want to be transmitting.
A 5-element Chebyshev filter (1996 ARRL Handbook, p. 16.9) is always a good idea.

Give the wide spread availability of the solid state versions (Palomar and other clones)
why go tubes for regular operations.

Now if you want a collectable item for "the era", cosmetically it looks to be in good shape.

Hi Greg (and Steve),

Your a little off track Greg, but I'll try to add in some corrections
where possible.

: In rec.radio.cb G. Beat <gregory.beat@home.com> wrote:
: Typical amplifiers sold in the 1960's and 1970's really for the CB market,
: but marketed "under the disguise" that it is for amateur radio (10
: meter band).
: Be advised that these are not amateur type accepted amplifiers.

More accurate to say the amplifier is of a style sold in the 70's, often
made for the 25 to 54Mhz band which includes the CB Radio Service. The
unit shown is a current production unit... made in Italy if my sources are
right. More and more, they are starting to pop up on Ebay and the news
groups. This one is not a vintage item...
-
Nope, they are not type accepted, nor were most of the legal amplifiers
sold back before the ban. They just had to make a legal spec for the most
part. Operation of the mentioned in the US Class D CB Band is not legal.
-
Operation in other adjacent services is/was possible.
-
: The dead give-away is the 5 watt input. Many early versions used old TV
: "sweep tubes" for the finals and were of questionably spectral purity.
-
While not orignally designed for RF amplifier service, the common sweep
power tubes can be used in an amplifier and with proper design care can be
quite clean in a linear application. It's all about doing the
proper design homework...
-
: They did not call these TVI or RFI monsters for nothing.

who is "they"..? Most people don't do the ground work to build a proper
sweep tube amplifier. Like any and all poor built/operated circuits...
the parts can get a bad rap.

Sweep tube amplifiers can be made quite practical. Many of the various
companies have put out various models through the years. Swan, Yaesu,
Dentron, Amp Supply, SBE ... the list goes on. Some were not so hot...
some were pretty nice.

: Be especially cautious of any units that have
: been tampered with the "urban legend" to remove the band filtering for more
: power.

Any tampering period... how come we haven't seen this "urban legend"
label before..? Wait a minute.... I've seen some pretty dumb posts about
removing the modulation internal limiter of a radio, made by Bill ...
that's an urban legend that's a lot of crap. So we actually do have a
current example.
-
: More power everywhere, except where you want to be transmitting.
: A 5-element Chebyshev filter (1996 ARRL Handbook, p. 16.9) is always a good
: idea.
-
You can actually do ok with just the pi output if your practical. But the
additional filter is a welcome addition.
-
: Give the wide spread availability of the solid state versions (Palomar and
: other clones) why go tubes for regular operations.
: Now if you want a collectable item for "the era", cosmetically it looks to
: be in good shape.
: Greg
: w9gb
-
Because it's a current production unit... Sweep tube amplifiers can be
heaven or hell. Your results will probably be different.

cheers
skipp

Hi,

that guy http://www.sonic.net/~shageman/hp310.html is using an HP310 for
VLF reception.

On my own I tested a W&G selective voltmeter (I think it was the SPM-5)
of a friend of mine for 137 kHz reception: selective voltmeters works
quite nicely for VLF, but the lack of AGC and noise blankers is a bit
unpleasant! They are quite handy however for comparing antennas, since
you can measure signal amplitudes very precisely.

The W&G had a 10 kHz IF output that was *very* useful, since it allowed
to receive faint signals using our DSP software directly digitizing the
IF with a sound card. Don't know if HP wave analyzers have such a nice
feature.

From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9s7bbh$q0e$1@plutonium.btinternet.com>
Source record: 48972

To wind a 3-to-1 turns ratio, 9-to-1 impedance ratio transformer, just wind 3 wires alongside each other around a ferrite ring about 2 inches (50mm) diameter. Eight or 10 turns of each of the three wires will be OK from 1.8 to 30 MHz. Use a wire gauge and a fairly thick insulation thickness which nicely fills the ferrite ring.

The ferrite core material should be HF grade, permeabilty in the range 200 to 400.

Connect the three wires in series for the high impedance winding and make the appropriate connections for the unbal.

And there you have it ! It will handle several hundred watts.

It will be easier than you think than the impressions you may have gained by listening to the old wives who love to complicate matters.

Source record: 48973

Which bleeder resistors should I use on a 5000 volt power supply? It is used on a 4-1000 amp. The capacitor bank I have constructed is made up of 15 computer grade capacitors with a value of 450 volt / 470uf. for a total of 6750 volts and 31uf for filtering. I have heard that wirewound resistors are not a good first choice because they can open up (burn up) and leave the cap bank charged. What should I use as far as ohm rating and wattage for these resistors?Thank you in advance.

Source record: 48975

If the mismatch at the coax switch is considered to be due to the
inductance of the length of the bare wire passing through the
switch we arrive at exactly the same conclusion -

Worst-case SWR = 1 + F * L / 1250

where F is in MHz and

L is length of bare wire through the switch in inches.

Which applies to solid Pe coax of any impedance.

Regards, Reg, G4FGQ

Thanks Sylvester,

Well, now that you made it clear what it is you are trying to do,
things are much easier. That was pretty silly of you to be thrashing
about with questions regarding supply voltages when it has so little
to do with your ACTUAL application. But we have got you on the right
track now! OK. Contrary to what you may think, I do not know
everything. No one can know everything. And since I don't consider
myself an expert in receiver design I cannot give you a solution off
the top of my head. BUT.....I bet there are a lot of folks in here
that can help you design a reciever that will monitor 33 channels
simultaneously, or at least get you the info you need. For instance
many commercial receivers have multiple VFO functions. How about a
design based on that idea?

Anyone with ideas that might help get Sylvester's receiver project
going, please feel free to join in.

How wide is wide? (50kHz, 150kHz, 1MHz, 10MHz, ???)
How clean is the signal you have to feed to the detector?

One possibility is a phase-locked loop, which could have nearly any lock range (therefore detection width) you want... another possibility is a quadrature detector directly at 137MHz, which might make sense for very wide signals. There are lots of other possibilities, including conversion down to an IF, perhaps to make use of standard commercial broadcast FM detectors or designs.

Hope these ideas help a little...more info about the requirement might get better answers.

Cheers,
Tom

No, I didn't throw the lamp away. What I found helps
a lot is a cap of around 0.2uF AC rated across the
powerline feed connected at the dimmer circuit. While
I was away, my mom bought a Chinese made floor
lamp with dimmer control. Very noisy. Well, she's
away for a few days so I took this lamp apart to
try to clean up the dimmer. With am AM radio tuned to
a weak station, I poked around the dimmer circuit.
Thus the above 0.2uF cap result. Also, the lamp
is made of metal, so to make this metal act as a
shield for the remaining RFI, I connected an AC
rated 0.01uF cap from the neutral to the metal.
(The dimmer circuit is completely in the hot side
of the line, the lamp has a polarized plug that
forces this to happen).

This may help for in the wall dimmers too. If
the house uses conduit or BX cable, that would
help act as a shield. Romex, don't know.

You've got a lot of faith that every outlet you are using doesn't have the
hot/neutral mis-wired.

Good luck.

WARNING WILL ROBINSON !!! Save the trip- Rat Shack has absolutely
nothing even close to a .2 AC rated UL cap. In fact, you will have to
order them or go to a real electronics house in a place like Dayton OH.

I repeat:

you have an excessive amount of faith that every outlet you use is wired
correctly.

there is no way to guarantee that your 'UL approved non-lethal leakage'
capacitor is going to remain that way

good luck

Geez Skipp, do you make this stuff up as you go along? Sweep tubes
were built for TVs, not radio amps: They work great in the kHz range,
but are terribly non-linear at 27MHz. The result is splatter all over
the band, regardless of how many filters you pile on top. The only
way they worked (with any kind of usefulness) was with heavy negative
feedback, and the tubes burned up very quickly. At the time when
sweep tubes were cheap it was a poor-man's alternative -- definately
not true today.

For UK based readers ,Brand New ,make Kiel - Germany (nearing end of shelve life) 12V ,18Ah gel type batteries are available from Mainline Surplus - Leicester for GBP 12.50 each (incl VAT) equiv US$ 18.25
I bought quite a few and am very satisfied with their performance .
I use them in the shack (charged by a wind generator + home brew charge controller limiting voltage to 13.8 V).
To keep the batteries healthy I discharge them every 3-4 months to 11.5 V otherwise they become 'lazy'.

My wife uses one with her electric golf trolley as a direct replacement for the original Yuasa battery which lasted 4 years .

Just for info

A scanning CB transceiver would be the obvious solution. I have two
in my junk pile. But the current requirements seem a bit high: the
4.8 amp rating for a 4-watt CB? Hmmm... regardless, that's only on
transmit. When receiving the radio draws much less current, and I
don't think he will be transmitting on 33 radios at the same time.
But ok. Now, the radios draw even -less- current when there is no

signal and the radio is sqelched, something on the order of 50 to 300 mA per radio, assuming LED displays. So the minimum draw will be about 10 amps, and if he transmits on one radio that's another 4 - 5 amps.... hmmm... He doesn't really need 160 amps, does he?

I hope you do not refer to 'certified ' electricians.

In the UK I have never heard of such a suspicion.
BTW all wall sockets are earthed ,each plug has an earth pin ,each plug has
a fuse.
Moreover most if not all modern/new houses have switchboard magnetic
circuit breakers rather than wire fuses and those circuit breakers
associated with wall sockets and heavy duty circuits for cookers and
immersion heaters incorporate earth leak detection (set @ 30 mA)

I have zero faith they are wired correctly. I guess you don't have any
radios, TV's or other devices in your home with .01 bypass caps hooked
to any metal parts, eh ? I'd like clarification on how this idea is
different in any way from thousands of other appliances ?

I think the trouble developes when a "'certified" electrician from the UK comes to visit friends or relatives here in the US, helps them with a little wiring while here, and gets confused by the differences in our color coding schemes.

When I go through the setup procedures for the analyzer I can set the center frequency just fine at 50kHz. The comb generator works exactly as it should, 20kHz +/1 less than 1 Hz. and looks fine on my 7704 scope. The spacing to the right of the center mark (50kHz to 100kHz) is exactly on, but the spacing to the left (0 to 50kHz) is only 80% of what it should be. (The SPAN adj seems to be set correctly btw.) I would have thought that if there were a problem with the sweep, it would be a linear function across the span.

Any guesses as to why the sweep would be different on one side of the center mark?

Frank;

My concern is this:

in the US, we have, at least in new construction, and in any which has been
updated, three-wire outlets

'hot' terminal, color coded brass or copper colored (black wire)
neutral', coded silver (white wire)
ground (what you refer to as 'earth'), coded green (green wire)

it is no trick at all for an inexperienced person to switch the wires going
to the 'hot' and 'neutral'

if this happens, any device using a 'neutral to chassis' (transformerless)
scheme will have its chassis hot in respect to true or earth ground.

in the US, your 'earth-leak detector' circuit breakers are called
'ground-fault-circuit-interrupters' (GFCI's) and may be either installed in
the breaker panel or incorporated into an outlet in the circuit; if the
latter is the case, all outlets 'downstream' from the GFI outlet will be
protected.

they work by comparing the current in the 'hot' and 'neutral' leads, any imbalance beyond a certain point will cause a shut-off of the circuit protected.

I'm not sure of the trip-point for our GFI's, but 30 mA sounds awfully high.

My concern with the original poster is this:

Given an improperly wired outlet;
and the possibility of excessive leakage through the capacitor he installed between 'neutral' and the metal part of the lamp, a potential shock (or worse) hazard exists.

Perhaps it is excessive caution on my part, but years of working around high-voltage, high-power broadcast equipment has made me err on the side of caution in these matters.

==========
I am afraid you 'll have to overhaul your knowledge base.

Sweep tubes can be very well used for RF linear operation.
The whole Yaesu range of transceivers in the 60s and 70 had them . They could also be found in Swan and other makes of RF equipment. There are even some published designs from the 1990s
The Yaesu FT -400 /401/560 had 2 of them in the final and worked well up to 29.7 MHz.

Last week I had a QSO with a G3 station using a Yaesu FT-200 (with 2 sweep tubes in the PA)
He has used the transceiver for the past 30 years and in all those years changed the 2 PA tubes only once. His signal is superb . The only sign of using this valve rig is the VFO stability .
When coming back after 1 'over' I had to adjust the rx about 100 Hz.
I am sure that after stabilizing the VFO power supply with zeners this would not be necessary.

I still have a FT-401 with 2 pcs 6KD6 sweep tubes , which I required a few years ago . After cleaning the switch contacts and general aligment I am sure it will be in an A1 condition again.
To extend the life of the sweep tubes they should not be run with an anode voltage in excess of 600 V.
Compared with modern rigs the rx is not all that sensitive ,that's the only negative point. Although even then with the many very strong sigs (often from High powered stations) this is not a serious problem.

GCFI breakers inthe US are designed for a 5 ma differential current. But,
that is only an approximate design objective and individual units could be
higher, though not likely much lower.

I find no reason to connect a capacitor between the metal case of a device
and "neutral."

Our National Electric Code requires that chassis and case be connected to
the a-c safety ground - our Green wire. The NEC requires that all
line-powered devices have their user-accessible metal parts be connected to
safety ground.

In the "old days" such as in the 40's, transformerless AC/DC radios, for
example, commonly had a "line capacitor" from the chassis to one side of
the line. In those days of unpolarized plugs and no real standard for
wiring or inspecting convenience outlets in the home, it was a crap shoot
as to whether the chassis was being returned to the line or to neutral via
the capacitor. Some designs also used a large resistor in parallel with the
line cap. A loud hum in the radio, sometimes tunable, was the clue that the
line cap had gone bad.

Funny the little things you remember 56 years later . . .

It's easy enough to check to make sure an outlet is wired correctly. You can get a testing plug at hardware stores or Radio Shack.

"In God we trust. ALL others we verify!"

It is very easy to check the outlets.

I find more than half of the outlets I check are either reversed
polarity
or have an open ground.

1) I KNOW that every outlet in my home is wired correctly
2) I do not install 0.01 caps from what is allegedly 'neutral' to exposed
metal parts on my appliances.

does that clarify it enough for you?

Here's another way to test for proper polarity: take a small neon tester, stick one probe in the narrow slot of the receptacle, the other probe in the grounded "U" hole or center screw. The light should glow.

If the tester doesn't light, test between the wide slot and ground. If it lights now, the polarity is reversed. It it still doesn't light, the receptacle isn't grounded. Either way, the receptacle should be rewired.

You are quite the bafoon Sparky... your follow up posts read just like the "grouchy ham hit the road types" mentioned on the last page of the http://sonic.ucdavis.edu/siltronix web page.

: Geez Skipp, do you make this stuff up as you go along? Sweep tubes
: were built for TVs, not radio amps: They work great in the kHz range,
: but are terribly non-linear at 27MHz.

Just because a device was designed for one application, doesn't mean it won't work well for other circuits. Sweep tubes can and do preform into the lower VHF spectrum.
Your terribly non linear statement is crap... They can and have been used in linear rf amplifiers that exceed past and current fcc spectral requirements, thus some could receive type acceptance numbers on the chassis (pre fcc 10 meter ban era).
Companies like Swan, SBE, Yaesu, Dentron, Amp Supply and others did a fine job making low cost linear rf sweep tube amplifiers. But of course, you know everything...

: The result is splatter all over
: the band, regardless of how many filters you pile on top. The only
: way they worked (with any kind of usefulness) was with heavy negative
: feedback, and the tubes burned up very quickly. At the time when
: sweep tubes were cheap it was a poor-man's alternative -- definately
: not true today.

I guess all the amplifiers I have working (on 10 meters) with their original sweep tubes need changing and an extra filter or two on board? Your lack of actual experience using sweep tubes in rf service is quite evident.
Something will have to be done... my restored sweep tube amplifiers are actually cleaner than my non modified type accepted Amateur Radio. I guess my spectral display tests are off the mark again... darn Agilent and original HP gear didn't hold up when I spilled coffee in the front panel...

I hate to rain on your faulty technical parade, but few if any of the above mentioned Amateur Radio - Company made rf amplifiers have negative feedback. You blow a lot of smoke there buck'o...

I do suggest most sweep tube amplifiers have a bit of degeneration installed as described in the Dentron Article above. But you can take your negative feed back back to your first year electronics class and

learn the difference between it and degeneration.

You might want to jump in with the neutralization crowd in your next post for a different angle. Darn sweep tubes in amplifier service seem to be working much better than you say they should.

Life goes on...

This is *exactly* why I follow the apt complex's electrician around
with a VOM whenever he's working on our wiring.

The phone wiring was pitiful. If I find anything on the AC lines done
that badly, I'm calling in the inspector.

While it is not what you are really asking, I have seen modifications to some of the scanners where the 455 khz IF filter is removed and a capacitor of around .01 mfd is instaled to pass the signal. What you really need is a wide IF filter to go along with the detector. As there is not usually many signals on that band at one time the wider selectivity is usually not much of an issue.

The lamp is a 2 wire with polarized plug. And the outlets in this
house are correctly wired (tested). And I found experimently
that connecting the metal case of the lamp and neutral reduced
the RFI. To avoid lethal shock hazard in case this lamp gets
used in another house which has miswired plugs, I used a 0.01uF
250VAC rated ceramic cap. 250VAC is equivalent to 1.4KVDC
(why that high: transient spikes on the powerline). Look at a
PC switching supply and you'll usually find 0.01 or similar
sized caps from both sides of the line to the case ground. Also
true of most VGA monitors.

If such radios are packaged properly, ie, no exposed metal
parts (including mounting screws) and captive knobs, it's
not a problem.

Maybe not, but you can mail-order out of the stack of catalogs they
have on hand from industrial component suppliers. As an example, I
can go into the local RS store and order just about any tube you can
think of out of their various catalogs.

For many orders, they'll pick up the shipping charges.

Steve,

First, you do not need an amateur radio license to hook anything up to a radio, but you need one to transmit. Go ahead an listen all you want. Second, if you are talking about software to run an old TU, you should think twice about whether you simply want to see the old box run, or whether you want to copy RTTY and/or PSK31, and/or other modes. For the first two, if you have a PC with a sound card, free software is all you need.

Try here for Zakanaka (PSK and RTTY, using the MMTTY engine) and also Logger:

http://www.qsl.net/kc4elo/main.htm

Or here for MMTTY (RTTY) and also MMSSTV:

http://www.qsl.net/mmhamsoft/

Everything you find at these web sites (Logger included) is free, meaning you CANNOT pay any money. Once you have the PC, and tones coming out of a radio speaker, your cost to listen is the cost of a pair of wires from the audio output of your radio to the mic or line input of the sound card.

It seems to me that if you want to use the CP-1 for the sake of nostalgia, you should leave it unmodified and find a Commodore into which to plug it.

Your next step should be to drop by Radio Shack and pick up a copy of "Now You're Talking," and we'll see you on the air soon.

Ok,
Fair question. Variable from 0 to 400 Hz.

It's the drive circuit for a three phase inverter. It is to power 3
phase aircraft instruments in a glider so weight and size are critical
factors. If they weren't then I'd do something similar to what you
suggest.

I would prefer to use sine waves rather than the more common square wave
switching type circuits as I don't want much noise and so would like to
save some filter components and hence weight and so on.

As the current required isn't much I was just going to drive a three
phase transformer with three push/pull transistor circuits.

Cheers

I have myself dozens of radios and appliances that come from the factory
with such caps, however. Such as every Philco I have, for example. Not
that i am even recommending doing this to lamps dimmers- I just avoid
using them as possible.

We needed to do much the same thing in our organs for the synthetic "Leslie" speaker system. Analog circuits are generally a bit of a nuisance. In early models we generated the three phase signals digitally, then filtered the outputs. Now, since we use a microprocessor, we have a sine lookup table in ROM, and a counter that samples it every 120 degrees. There's more to it than that, but that's the basic idea. You could probably utilize a PIC to do the whole works, with an external D-A converter, an analog multiplexer and 3 sample and holds. It would be absolutely stable and fairly small.

good question

I've only seen the term 'diplexer' used to describe two transmitters to one antenna (TV station, once in a while 2 broadcast stations will use a common antenna)

Perhaps because the term 'diplexer' implies that both transmitters (both frequencies) will be active at the same time

Source record: 48876

I think conventional wisdom uses about 25-50k resistors, 25 Watt rating, across each capacitor. And they are wire wound.

Yes, an open one can cause trouble and I've seen it happen. But if you rate them conservatively and use high quality resistors you are probably safe.

The ones I saw give problems were not marked with a known brand name and were of poor appearance. The old standby US made shiny brown units, or in some cases charcoal gray, did just fine.

If you use 25W resistors make sure the actual power dissipation is less than half that, worst case. So if you have 400 Volts on a resistor, use 12k Ohms or more. This results in 33 mA of bleeder current in normal operation. The time constant with 300 microfarad capacitors becomes 3.6 seconds, so make sure after power is off, that you wait a minute or so before touching anything.

Reducing RFI from lamp dimmers.

Buy a lamp dimmer from the last 2 decades and replace the one you have from the 60s.

Any good quality dimmer like those from Lutron will be shielded and do not cause RFI to AM or shortwave radios. If yours does, it is old and probably the kind that you turn with a round knob. Time to get a new one, they don't cost very much.

Ummm, I think what he's saying is that he is selling the 'Power Station' product at reduced price; not just the battery and chargers. On the web page the 'Power Station' goes for $49.95 + about $11 shipping. So the price is down $10 which about pays for your shipping.

At least, that's how I read what he says below.... 8=)

And you use toilet paper in your typewriter, too, huh? I never said
no amps were made for sweep tubes, I said they are non-linear when
used as an RF amp. And they are. I also said they can be made to
work with a reasonable amount of linearity, but not very efficiently.
AND I also said that if they are not linear, no filter will make
them linear. Why do you insist on putting words in my mouth?

> working much better than you say they should.

I would like to see your data, because I haven't seen a sweep tube amp that didn't have spikes up the spectrum or noise sidebands less than 200kHz wide.

Now where did I say that degeneration = neutralization = negative feedback? I didn't. But it's obvious that you don't know what the terms mean. 'Neutralization' is degeneration included so to prevent oscillation. 'Degeneration' is any type of method used to limit the open-loop gain of an amplifier, and includes 'negative feedback'. And if you take a real good look you will see that the 'neutralization' added to an RF amp is usually in the form of 'negative feedback'. Degeneration is used to reduce distortion, and is usually done with either a cathode resistor or negative feedback. If distortion is heavy, as in the case of sweep tubes, both should be used.

Also, you seem to be under the mistaken impression that just because an amp was mass produced by a well-known company that it necessarily -must- be a good design. Corporate America has provided many examples proving that to be false. But I'll tell ya what, Skipp: You provide just -one- example of a commercial radio that uses a sweep tube for the RF final and I'll eat my words. I'm not talking about junk made for some impoverished amateurs, but radio equipment meant to be used in a commercial radio service. Just one. How about it?

If it is a tapped coil, the normal is 1/4 of the turns up from the bottom. The inductance is determined from the standard equation F = 2*Pi*Sqrt(L*C). C is Farads. C in pf is 1x10**-12. L in in Henrys. It will likely end up somewhere in the 5 to 10 uH range (10*10**-6). C you can determine from the capacitors in the VFO circuit.

Knowing L, you can pick a Toroid core to wind the inductor on and calculate the number of turns needed.

I may be talking through my hat here, as I often do, but aren't the
finals in the Yaesu FT-101 sweep tubes. How about the finals in the
Drake TR4 series? Y'know, I think I'll go over to the Drakelist and
ask. More later.

If you are not happy at the thought of a bleeder resistor becoming
open circuit use two in parallel. This squares the probability of
failure. 1 in 10000 improves to 1 in 100000000.

6847. Sweep Tubes

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-07 03:03:32 UTC
From: rcnixon@mindspring.com
Message-ID: <3be8a3ed.9439021@news.mindspring.com>
Source record: 48894

Yep, I just checked. The 6JB6 finals in the Drake "4" line are indeed sweep tubes. No one seems to have complained too much over the last thirty or so years about the non-linearity of the finals in Drake equipment. In fact, the audio of thost transmitters is pretty good. Usually about 150 watts too.

Here is the latest program (still developing), please check
http://www.verkhovyna.com/radiofest.htm
for the latest updates

****
Program for 2001 Radiofest Eastï¿½
and DX-Contestvention at Verkhovyna resort in Glen Spey, NY

Due to shortage of promotion time and concern of some contest club's members this year's program will be compressed to one day event on Saturday Nov. 10, 2001

Come, see the place, meet the people, enjoy presentations, have fun!

8:00 am Breakfast, fresh NY bagels, muffins with fixins and fresh Starbucks coffee

10:00 - 12:00 am Antenna forum

10:00 - 10:45 pm Quads, multiple polarizations and techniques by Ken "Judge" Glanzer, K7GCO
Advantages of Quads, ways of feeding, 6 polarizations, multibanding, applications for contesters.

11:00 - 11:45 pm Miracle by the ocean by Yuri Blanarovich, K3BU, VE1BY, VE3BMV
Salt water phenomena and ground effects, vertical magic, search for the most effective vertical radiator, 3/8 vertical, 4-square, quad loops, EZNEC modeling, practical results and comparisons 4 square vs. 3 el. dual polarization Quad at Cape Hatteras, NC vs. NJ

12:00 - 01:45 pm Club's Lunch meeting - official "business meetings" of participating clubs
Welcome by UACF President Steven Kapczak
Business meetings of FRC, YCCC, PVRC, MRC, NJDXA, ?....
Cold buffet lunch available

01:00 - 04:00 pm Extreme Contesting Forum

1:00 - 1:45 pm SO2R on the same band by Yuri Blanarovich, K3BU, VE1BY, VE3BMV
Problems and techniques of using two or more radios on the same band, interference, phase noise, RX overload, polarization diversity, switching system. Application is SO or MM situations. Display and demo of hardware on 10m.

2:00 - 2:45 Invited speaker (KQ2M?)

3:00 - 3:45 On the way (V26B?)

5:00 pm PIZZA BEER Party
"Banquet" speaker. Tesla RC President Yuri Blanarovich, K3BUï¿½
History of Verkhovyna resort, plans for development and activities, home to ham radio, camps, meetings, conventions, plans for building N2EE M/M Tesla RC "mother of all contest stations"

Yuri's famous gourmet Ukrainian Pizza, salad buffet and Spaten Oktoberfest Beer on tap courtesy of Tesla RC and Verkhovyna Mountainview Resort will be served. Giant hospitality suite, bar, mingle with big guns and little pistols, tell the lies, show your slides and videos and have fun as long as you can stand it.

Admission free, tax deductible donations to UACF Verkhovyna Building Fund are welcome.ï¿½
For directions, more information and latest updates please check www.Verkhovyna.com and click on RADIOFEST

See you all there!

I use an HP3586B Selective levelmeter, it lacks AVC, and hunts a bit in volume level unless you set the meter to average or fix the input range. I am thinking of adding a simple AVC circuit to add to the audio output. You can pick these up for about $400 or less. They were many thousands new, but now analog microwave maintenance is a "lost art" so you can find a bargain. Be sure to check the power supply board as there is a (3volt?) nicad battery that tends to leak and needs to be replaced to hold the memory functions. Also check Aniritsu, they make a similar product that looks like a fine instrument. One things for sure, these are very accurate receivers!

Home Depot or the like will have various sizes of ducting, including
the setup for a built in shop vac system, dryer venting, air ducts,
etc.

You could also try McMaster-Carr, www.mcmaster.com or Grainger's
www.grainger.com, both of which sell all kinds of industrial goodies.

Happy trails,

About 10 years ago, I bought a heater hose at my local Penn
Jersey auto parts store. I am looking at the box right now and
it is 2 1/4" dia. and 6ft long. Looks just like those flexible
dryer hoses (4") with the coil spring running its length, except
the plastic is black and of course it is smaller dia. If your local
auto parts store does not carry anything like this, you could
probably get hold of a J.C. Whitney mail order catalog and
order one. BTW if you could adapt to and use a 4" dia. hose,
that would be *way* better, and it would be well worth the
effort to try to find one that expands out with the smoothest
possible inner wall. The more expensive expanding aluminum
dryer hoses are much better in this regard. Longer lengths
with too much 'ripply' wall texture or too small a dia. will cause
restriction, especially due to turbulence, and your powerful fan
may no longer move enough air due to the excessive back
pressure. With a 15 ft. run of tubing and only 2 1/4" dia, you
better have a pretty powerful fan. Bigger pipe would be better.

Well, when you're dealing with kilovolts at amps, I can understand that level of caution. Here, however, we are dealing with a lamp which at most, if miswired, has 120VAC (US standard, Frank) on the chassis if the chassis is ``grounded'' to the ``neutral'' lead.

I've been hit by a badly grounded institutional refrigerator before, as well as hit by a hot wire I didn't know was hot. It's not bad. Believe me---if he has a miswired outlet, he'll know it the first time he touches the lamp. Getting shocked by 120VAC isn't that nasty. Of course, there are always exceptions, however I would tend to believe that a low-current line-power shock wouldn't tend to be lethal.

In any case, however: Test that outlet! Better to be safe than sorry.

Good Luck,

6857. Re: SWR due to coax switches

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-07 12:03:38 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9sb8p6iof2@neptunium.btinternet.com>
Source record: 48903

Don't use an ordinary capacitor. Its working voltage will probably be exceeded at some time or other. Just use a very short length of coax, a bit less than would be needed to pass through the switch contacts if the switch wasn't there.

The whole idea is to replace the capacitance of the missing short length of coax. If you don't know what the capacitance is just replace it with the same little bit of coax line.

Solder it to the switch's common input socket where it is always in circuit.

If you are pernickety, trim length for minimum SWR on the feeder. But how will you know whether the SWR is not due to a dozen other things which can cause the SWR to exceed 1-to-1 ? Best thing to do is nothing unless you are attempting to push a switch beyond its normal working performance.

Regards, Reg, G4FGQ

I don't think such a thing would be a 'balun', since one winding would
be common to both sides. What I suggested in an another post was to
wind 4 wires. One would be the primary and the other three the
secondary.

> not true today.

Some TV's used 807's for the Horizontal output, and the tubes are NOT
built for a 15 KHz bandwidth. A Horizontal output is a PULSE
AMPLIFIER. Several of the early B&W Sweep tubes were IMPROVED 807's,
with modern bases so they could be made cheaper, and with the same
equipment other consumer tubes were built. Is the 8950 a TV tube?
Yes. It's the 6KD6 with a 12 volt filament. Several tube manuals
simply list the filament specs, then tell you to use 6KD6 Specs, because
they are built with the same internal components. As fare as being
non-linear, EVERY amp has some non-linear properties. After all, they
are used in the real world, not just on paper. By the way, some early
color TV's used 6146's for sweep tubes.

You are right, what Reg described is a balanced to balanced transformer. The
quadfilar winding I suggested in another post in an unbalanced
to unbalanced transformer. What Reg is suggesting will work fine
if used in conjunction with a 50 ohm to 50 ohm balun. That
is what I used at the ends of my 450 ohm open wire line. After
much research, I concluded that you cannot do 50/450 ohms and
unbalanced to balanced in the same device.

Much like the radio collector who told his wife if she ever saw
him being shocked not to grab him but get something like a board
and knock him loose from the voltage source. One day she came into
the kitchen and saw him standing next to the cabinet with his back
to her and he was shaking violently. She noticed a cord running
from him to the cabinet. She immediately rushed to the back door
where she found a length of 2X4, picking it up she rushed back and
swung with all her might, knocking him across the kitchen,
breaking his arm and two ribs. Up to that point he was happily
listening to his favorite song on his walkman.

As it happens, I wasn't talking through my hat. The Drake "4" line
and the Yaesu FT-101 both use sweep tubes as finals. Hmm, imagine
that. In over thirty years, no one seems to have complained all too
much about their non-linearity. In fact, both are known for good
sounding transmitted audio. Someone else pointed out that ALL amps
can exhibit non-linearity somewhere in their operating regime, but it
can be designed around. Oh, yeah, both transmitters put out about 130
to 150 watts.

Simple pre-selector consists of parallel tuned circuit with random wire antenna and receiver tapped down coil.

Enter diameter and length of coil former (toilet roll tube?), tuning capacitor maximum pF, mid-band frequency, antenna length, receiver input resistance.

Program will tell you wire gauge, number of coil turns and where to tap things into. Also 20 dB bandwidth.

Download in a few seconds from website below.

> together into a common load.

Gee, I guess all these years those two stations in Minneapolis using a
'diplexer' into the KQRS-AM array haven't been doing it properly; since they
are on different frequencies.

Two transmitters into a common load, yes. Required that they be on the same
frequency, no, witness what TV stations call the device that puts the visual
and aural transmitters into the feed line.

>The converse of this being a splitter,
> which is electrically the same but wired backwards.

nope.

'duplex' means simultaneous transmit and receive, as in 'full duplex'

Most all of the new dimmers are RFI suppressed, including the
Lutrons. The problem is less that they radiate RFI, but that they
still put switching transients on the mains, which is where most of
the noise getting into vintage sets comes from.

To cure this requires two things: Chokes on the mains to suppress
the transients, and caps to bypass the noise.

This is true of new dimmers, including the Lutrons.

Hi

Although not active in the hobby, I passed my RAE in 1983, and now use 3.5kW transmitter valves for audio rather than RF - see www.sound.au.com/kolok.htm for details.

I have heard of ghastly fatal accidents to people constructing copper vapour and copper halide lasers (EHT PSUs), and have heard today that every amateur radio group knows of someone who had a similar accident while trying to build a high power valve-based linear amp.

Is this folklore or truth? I am a father of two, and if the risks associated with my 6kv valves are as great as they would appear from this anecdotal evidence, I may have to cut short my involvement.

Are you talking about people somehow getting between the HV and
ground, or liquid getting into the PS cage or the final of the
amp, or do you have something else in mind?

I've been working with this stuff for 40 years now, and haven't
had anything worse happen to me than a capacitor explode and
imbed itself into the ceiling while I was working on the
(admittedly not HV) power supply. I haven't lost any friends or
co-workers to misadventure with their equipment, either.

But I'm not the only electron-pusher in the world, and I've
always steered clear of stuff in the multiple KV range.

Hi all

yeah yeah, i find this "easy" way to make a 9:1 tranformer, you can look it at:
http://www.kc7nod.20m.com/new_page_1.htm.

Too easy, well for the mathematics fan try this:

6873. SB-200 amplifier repair

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-08 00:08:59 UTC
From: Rich Griffiths <richg@one.net>
Message-ID: <3BE9CD1B.8F1D6BC2@one.net>
Source record: 48918
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I recently picked up an SB-200. It wasn't behaving quite right, but the price was very good.

It had about 30-40 mA of plate current when it was unkeyed (should be zero), about 60 mA when keyed but idling (should be 90), and about 250 to 320 mA when driven (should be 500). The grid current readins were similarly weird. The plate voltage was Ok.

I found a bad resistor on the grid of one of the two 572B's and an out-of-spec resistor on the other. Each tube is supposed to have a 33-Ohm, 1-W resistor connecting the grid to the bias line. One resistor reads 42 Ohms; the other is disintegrated. That explains the symptoms.

Now ... is there a Heath-amplifier expert out there who can tell me if I should just go ahead and replace those two resistors? Should I still be searching for a cause of the failure? (I don't see any obvious cause.) At one watt, I would think they could easily handle the expected dissipation (50 mA per tube => about 80 mW per resistor). Should I go for 2-W resistors anyway?

... Rich W2RG

Hi Michael...

: In rec.radio.cb Michael A. Terrell <michaelaterrell@netscape.net> wrote:
: Some TV's used 807's for the Horizontal output, and the tubes are NOT
: built for a 15 KHz bandwidth. A Horizontal output is a PULSE
: AMPLIFIER.

I'm about laughing out loud to think of a poor old 807 screaming it's fool anode cap off doing horizontal output duty. That must be one really old TV. An 807 tube is a very popular audio amplifier tube and it was the subject of some HF RF Amplifiers. I have a few articles in my files of said. Some even converted the similar 1625 to audio service.... boy we're going way back now.

: Several of the early B&W Sweep tubes were IMPROVED 807's,
: with modern bases so they could be made cheaper, and with the same
: equipment other consumer tubes were built.

: Is the 8950 a TV tube?
: Yes.

No it is not... no TV that I've ever seen or heard about had one. As I mentioned, it was designed by GE for beam power applications.

: It's the 6KD6 with a 12 volt filament.

No it is not, the 6KD6 has lower transconductance, lower plate dissipation, different internal capacitance values and probably a different pin out. The closest conventional sweep - beam power tube to the 8950 was/is the 6HF5. One can upgrade a Swan 350 from the 6HF5 to the 8950 with relative ease. I have done a few in my day.

: Several tube manuals
: simply list the filament specs, then tell you to use 6KD6 Specs, because
: they are built with the same internal components. As fare as being
: non-linear, EVERY amp has some non-linear properties. After all, they
: are used in the real world, not just on paper. By the way, some early
: color TV's used 6146's for sweep tubes.

Similar but not exact... the 8950 along with the similar type Maco output tube should be treated as different. Not only was the 6146 used in TV's, one can find it in the very popular early Ampeg SVT Bass Guitar Amplifier. Loud as heck and heavy like a boat anchor... but man it has some tone.

cheers
skipp

Hi Rich,

The most likely root cause of the grid resistors being damaged is someone overdriving the amp or applying an excessive drive signal for too long during tune-up. There is a possibility of a problem with the 572B tubes but if the idle current is correct with the resistors repaired then the tubes are probably usable.

I have had the SB-200 and never had any problems even running AM mode at very reduced drive levels.

Not at all. Not even the SLIGHTEST noise difference on AM or SW when turning the lights on or off, or dimming them in-between with the RF shielded Lutron dimmers. ...now when I try to use one of my x-10 dimmers, then you can't listen to the radio at all, not even in another room.

Rich -

You should perform a "visual" test for other cracked or
bad components. I also perform a "nose" test to check for
burnt components.

Going to a resistor with a 2 watt rating should not be a problem.

Consider adding the "soft key module" (Harbach)
to lower the keying voltages for the modern solid state transceivers

The "soft-start" is a good idea, but a personal choice.

Then you obviously were not around in the mid to late sixties as the Drakes and other sweep tube final rigs were notorious for their splatter but the bands were much less crowded and everyone lived with it. I happened to have been a Drake owner at that time.

Don't think this has been done but you might search for hamcom type programs. It uses an IC to square up the waveforms. Several programs have been dwritten for that type interface.

Also several sound card programs have been written to sample the waveforms.

Look here for some place to start:

http://www.muenster.de/%7Ewelp/sb.htm

????

I have no idea what you mean by "sample the waves," but you're
going to need to give a much more exact description of what, exactly,
you're trying to do before you'll get anything resembling an accurate
answer.

> Can this be done?Any pointers/reading material is appreciated.

It's not so much a question of "can it be done?" as "Why in the
Multiverse would you want to bother?"

If you're looking to do spectrum analysis, then get hold of a
decent spectrum analyzer. If you're looking to find a computer-controlled
FM broadcast receiver, there still exist PC-installable FM tuner cards.

If you're looking to get hold of a software-defined VHF radio that
you can have some fun assembling from kit form (WARNING: Not for
beginners! Assembly requires experience with surface-mount components,
top-rate tools, and good soldering skills), then check out this link:

Look for dust collection hose at woodworkers supply houses. I think you should be able to find it in a 2 1/2" diameter size. You can also find universal adapters that will attach to anything between 1" and 4" in diameter.

I don't know about hooking thru a serial port, but if you simply want to
see/analyze/modify/record what comes out from an audio source, then
there are a zillion different audio programs that do that type of thing
via your sound card.
Cool Edit, Nero, DC-Art are some examples of programmes that do this.
Search google for their sites.

Dean -

I would try the normal surplus dealers
(Fair Radio, Lima Ohio; Leeds in Brooklyn, NY; and in Texas, etc.)
Sounds like the specification for an HW-16 or DX-60B transformer
----

Try Surplus Stuff - I got lucky here with their current surplus Collins
power transformer
http://surplustuff.com/xfmr.html

Here are some of my standard look-ups - at least for the telephone call

Cin-Tran, Cincinnati, Ohio was one supplier of Drake Transformers
http://www.cintran.com/

Heyboer Transformers, Grand Haven Michigan
They supplied some Heathkit transformers
http://www.heyboertransformers.com/index.shtml

Peter Dahl
Peter can wind or fix about any transformer.
He may not be the cheapest price, but solid quality.

> ... Rich W2RG

I don't think it would matter much on the size of resisters. If you
have the manual I believe they may have a "before start" checkout
routine that you can follow. You check resistances etc, with no power.
I'd go though that before you fired it up. It's possible you could
have a bad tube or two. MK

"Similar but not exact"? What happened to your "not a rock solid rule"
excuse? Oh well...

I did a little research, and the 8950 was a 6KD6 beefed up for RF
service. It didn't get much call except for inexpensive amateur
equipment (just like sweep tubes), then it died.

It doesn't make any sense that a TV set would be designed using a
6146 for the sweep tube when less expensive and more capable tubes
exist. I have TV service manuals for sets going back to the early
50's and none of them use a 6146. Maybe you can enlighten us as to
the make and model to which you are referring?

It is common practice in the USA to call both devices (the one for combining
multiple MW stations into a common antenna, and the one for combining the TV
sound and picture transmitters into a common antenna) "diplexers". It's
not at all unusual for technical terminology to vary significantly across
the Atlantic!

Feed a 1kHz tone through a variable resistor to the headphones.

Adjust the resistor until Vresistor = Vheadphone. VR is then roughly
the same as the headphone impedance.

Mark.

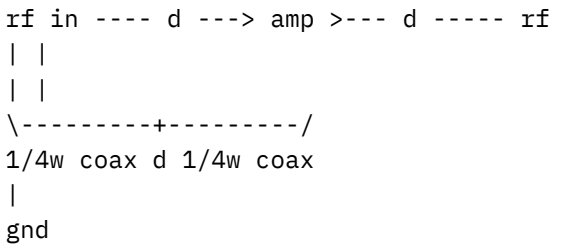
Hi,
I'm thinking of using 1/4wave coax + diode switching for TX/RX control
of an FM RF Powerblock amplifier (SAV-7 or M57737 300mW in 20W out)
as below.



where d are two diodes back to back.
any comments as to why I should'nt do it this way ?
thanks Mike W, G8NXD

Source record: 48747

Regarding the 807, it is an excellent amplifier tube and very rugged. It is useable in class C up to 50Mhz. One company, (Harvey Wells) made a multi-band transmitter and pushed the 807 clear to 144Mhz. Not efficient, but it worked.

Regarding horizontal output or "sweep" tubes. You can look at things in either the frequency or time domain. Consider the rise times necessary for horizontal output use - convert this to the frequency domain and you will find this old bottle will run with the best of 'em.

The 6146 also makes a hell of a good amplifier as long as you watch the screen voltage. If you want to run UL you'll need a separate winding on the output transformer. Oh excuse me, you guys say "tranny."

I once had a Heath amplifier (similar power levels, 1w in/10w out, same band) that was switched that way. Worked fine. Unfortunately I no longer have the amp so I can't pass along any details but it sounds like you've already thought it out pretty well.

Well, people work around higher voltages than that all the time, with very few accidents. I think it comes down to designing things properly and taking the proper precautions. Professional broadcast equipment comes with interlocks that disable the power (and often also discharge any large energy storage components) when the cabinet is opened. Smart people don't disable those interlocks; and they put them on their home-built equipment as well. When you measure things, use the proper equipment and technique. Take to heart the old addage, "always keep one hand in your pocket." Don't have any holes into the equipment HV areas that are large enough to accomodate a pencil. Provide for safety in the event that the primary insulation between the HV and any output (or input, or control) terminals is lost. In summary, think ahead in the design, testing and maintenance of the equipment: anticipate the things that could go wrong, understand what you're going to do to keep you out of harm's way if they do go wrong, and then re-think again.

Cheers,
Tom

> the make and model to which you are referring?

The 6146 was a very popular final output tube used for
low band VHF service (30 - 50 MHz) commercial radio units (Prog Line?)
from General Electric (GE). The RF section was one of the most
solid designs from the period. Of course, they were selling it to
the local and state law enforcement agencies. The only problem was heat.
Today, small reliable fans, Teflon wiring and modern capacitors
can be easily address and handle this issue.

Now you have me thinking about a winter project.

greg

1. View headphones
2. If big and clunky, goto 4
3. goto 6
4. Place headphones on head
5. If heavy and uncomfortable goto 8
6. Headphones are about 4 ohms
7. Stop
8. Headphones are about 1K ohms

Mark's way is a little more scientific.

Ouch! There is nothing low-current or non-dangerous about 120-volt AC
line voltage.

The severity of electrical shock depends on the current flowing through the
victim, the current path, and sometimes on the frequency, if the current
is AC.

Assuming you have a current path that involves some vital organ(s), such
as the heart or lungs, 10mA is very dangerous, and many medical texts
simply say that currents of 25 mA "are lethal".

A current path through or across the chest is about the worst, which is
the source of the old electrician's maxim, "Keep one hand in a pocket."

AC power can also have the effect of fibrillating the heartbeat, and 60Hz
is a frequency right in the "most effective" range.

Because electrocution is caused by current, anecdotes cut both ways, as
human skin resistance can vary by three orders of magnitude. I certainly
know someone who put 800 VDC between two dry hands, and got nothing more
than a wake-up jolt; yet an old book on telegraphy asserts that one
unlucky man was killed by a 22.5 volt DC battery bank.

Sorry to sound like a scold, but any representation that line power isn't
lethal stuff is more than nonsense, its DANGEROUS nonsense.

Robert Wieland, who used to be in charge of Electrical Safety for the College of Engineering, University of Delaware.

P.S. Putting something across a solid-state dimmer to reduce the generation of RF interference is old stuff, in the 1970s, every dimmer & "speed control" schematic had a series combination of a resistor & a ceramic capacitor, which was called the "snubber network". Sounds like low-bidder equipment is now leaving that out.

There really is no way to keep an SCR from making chop (not RFI as other intelligent life forms have illuminated, though it is line-current interference). Whether the chop affects one radio and not another is up for grabs and is the real world. For my shop area, I ended up filtering its whole branch ckt with a 20 amp L-C network on both legs. I found the filter dirt cheap from a reseller, and I wish I'd gotten a dozen & put one on every branch, to isolate it from the line-current interferences originating on other branches.

The idea is great when applied at a corded appliance. Where things fall apart is where folks start assuming they can safely modify a wall-mounted light dimmer without affecting its safety rating. Heck, an extension cord my be UL approved, but does that mean it can be used in place of romex for in the wall wiring?

Also, big difference for UL caps for line bypass and ACROSS the line ratings.

So, you don't replace wax caps with 200 or 400 VDC ratings when used in early radios between the chassis and AC line? UL approved caps are made for that purpose.

Many early SW receivers, such as Hallicrafter S38 used a wax paper isolation cap between the 'hot' chassis and metal cabinet... 50/50 shot on the line cord polarity, and worse odds on the leakage currents in a 50 year old under-rated wax beauty.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information

posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis- trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is NOT the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent. This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

6921. Cardboard Box MW antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-09 06:43:20 UTC
From: "Gary \"Joe\" Mayfield" <gary_mayfield@hotmail.com>
Message-ID: <cWKG7.110216$kf1.33574966@news1.rdc1.ne.home.com>
Source record: 48768

A while back someone posted a link to a project called the "wave catcher" or something like that. It was a box with a few turns of wire around it, and variable cap for adjusting. Would some please repost the link?

Thanks and 73,
Joe

If you're thinking of the HA-201, it did have some precautions during the
initial tuning and alignment, but it looks as though most won't apply here.
Some which may apply:
Do initial testing at 11 to 12 volts before running it at 13.8 volts.
Watch for a low frequency oscillation. (possible, but unlikely, manual
says.)
Keep transmissions short during checkout.
Coax from radio to amp was odd multiple of quarter wavelength.

Thanks John, FYI the SAV-7 are available over here at the moment for a seriously good 20 ukp each or two for 30 ukp.
I built the amp last night and I'm due to cut the 1/4w lines this afternoon, strangely enough using RG174 and 1N4148 diodes. Its a small world ;-).
The complete project including a miniature BPF fits in a 100mm x 60mm x 30mm diecast box. I hope to get a webpage up about it soon.
Thanks for your comments, I was wondering where to start on the stub lengths. ATB Mike W, G8NXD

Hi Joe,

Do a Google search for loop antenna, you will find lots of info.
IIRC you need a 240uh coil and 365pf variable capacitor.
Mike

6926. FS: 1941 "Radiotron Designer's Handbook" $9

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-09 13:15:03 UTC

I currently have for sale a 1941 copy of the "Radiotron Designer's Handbook" third edition, published by the Wireless Press. The 352 page hardbound book is in good+ condition, clean with no page tears or pen marks except for a previous owners name inside the front cover. Black cloth covers show some wear along the edges and at the top of the spine, but not too bad. A nice vintage text prepared for the radio set designer. Available for $9 plus $2 postage (book rate within the US). If interested, please email to "Oldbooks78@aol.com" to reserve. Thanks.

Dave

Yeah, we all read that and were told that BS in school, yet as many times as I have gotten shocked by so much more, and zapped from the 120 ac line throughout my long life, I laugh at that. People get struck by lighting and survive, so fear not your electrical outlet.

> AC power can also have the effect of fibrillating the heartbeat, and 60Hz
> is a frequency right in the "most effective" range.

You sound just like Thomas Edison who said the same thing about Tesla's 60 Hz AC system and would go around finding lost dogs and cats and would electrocute them to death trying to scare people from Tesla's 60 Hz AC system and stay with Edison's DC system of supplying homes with power.

Telsa would play with AC and high voltage devices all his life, said they were healthy, and lived to a very old age dying in his sleep, not of any cancer.

> than a wake-up jolt; yet an old book on telegraphy asserts that one

Do you know how many AMPS you can get from a car battery? Ever try grabbing one hand on each post of a car battery to see what happens? Absolutely nothing.

> Sorry to sound like a scold, but any representation that line power isn't
> lethal stuff is more than nonsense, its DANGEROUS nonsense.

I'll agree with that! What ever adjective you want to put in front of it is fine.

Your program has many floating point bugs due to poor handling of
numerical exceptions. For example calc.c:float2prefs, you take the log
of negative numbers and zero values. Plotting Q circles cores, because
you divide by zero...

No, the point was all the old dimmers cause noise, but not any of the good quality new ones. There were no quality shielded old ones put into homes at the time of construction.

But yes, you can still find cheap $3 dimmers today that are not RF shielded and cause just as much noise as the one your are replacing.

6931. FS: Some nifty dual conversion IF/detector modules...

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-09 19:32:57 UTC
From: tongaloa <tongaloa@alltel.net>
Message-ID: <9shb3m$97$1@iac5.navix.net>
Source record: 48778

I've acquired some of the modules described below.
Photos and ordering instructions at:
http://199.184.215.33/catalog/view_item.php?id=256

<pre>
(C)2001 Bob Duckworth

Ultra cool dual conversion IF/detector module.

Block diagram, See photos as well

RF In>-[4pole 45MHz]--[Mix]--[2pole 455kHz]--[IFamp]--[2pole
455kHz]--[limiter]--[FM det/LPF]-->Audio

I've left out the 45MHz amps in the block diagram.
44.545 MHz xtal osc is used for mixing
AGC operates on the 455kHz IF amp and limiter and is available as RSSI
(received signal strength out)

Note: Limiter follows second 2nd IF filter. I am looking into possibility of
converting this stage to a linear stage and picking the band limited
signal off for input to a PeeCee sound card for digital detection and
audio gain. This should make it possible to demodulate AM, FM, and SSB
to make a more general purpose radio. Some detail of the 2nd
IF/detector
is included at the end of this document.
Note: IF bandwidth is about 30kHz at 6db down. This should be narrow enough
for 88kHz sampling by the sound card.

Use for radio receiver experimentation.
All you need to add is a tuneable RF converter
(VFO and mixer) and an audio amp and you have
a complete radio receiver.

There are many sites on the internet where you
can find schematics for a suitable RF stage.
Run the audio into your sound card, use an IC
audio amp, or ???

Specifications: operating supply 5.0Volts

Input Nominal Frequency 45MHz
12dB SINAD Sensitivity Max. -115dBm fa=1kHz FM=8kHz
Signal/Noise Min. 50dB fa=1kHz FM=8kHz P=-40dBm
1kHz output level -10.5dBV +-2dBV fa=1kHz FM=8kHz
RSSI output level Max. 1.6V P=-110dBm
Min. 1.1V P=-104dBm

Max. 2.5V Min. 3.7V P=-40dBm
RSSI Dynamic Range Min. 60dB
Intermodulation Ratio Min. 65dB deltaF1=+-60kHz
deltaF2=+-120kHz
Single Signal Interference Min. 70dB RSSI Output Constant
Power Supply Current Drain Typ. 5mA Max. 8mA

Nominal Input Impedence 50 Ohm
Max DC Supply Voltage 9.0V
Load Impedence Audio output 100k
RSSI output 100k

My actual measured specifications, operating supply 10V
This prior to learning that recommended Max Vcc=9.0V :-)

Power Supply Current Drain Vcc 5V to 12V = 10mA
Fo = 45MHz Delta F = +-10kHz @ 400Hz Audio OUt=0.14V RMS
12dB SINAD Pin ~= -100dBm
RSSI -60dBm = 9.5V
-80dBm = 8V
-100dBm = 6V
-120dBm(noise floor) = 5V

Dimensions, L x W x H, not including 26.0mm x 21.0mm x 10.0mm
pins and mounting tabs H 3.8mm
Pins 0.5mm x 0.5mm
Tabs 1.0mm x 0.4mm

Pin designation 1. Vcc
2. RSSI (Received Signal Strength Indicator)
3. Audio Out
4. Ground
5. 45MHz In

Some information on the 2nd IF amplifier/limiter/FM detector/AGC/Audio IC

The chip is a Sony CXA1002N which has been discontinued for some time.
It's a 16pin flat pack mounted on the underside of the modules double
sided board (see photos). Pinout with some notes re: internals follow...
or download the data sheet, in Japanese, from Sony at
http://www.sony.co.jp/~semicon/japanese/img/sonyjd01/86801565.pdf

1. 0.0V G
2. NC
3. NC
4. 5.0V Vcc
5. RSSI out (collector)
6. 2.5V Audio Out (totem pole)
7. 3.3V Quad In (base)
8. 1.7V Limiter out (emitter above 8k to ground)
9. NC
10. 1.7V Limiter DEC2 (15k pair emmitters, 15k pin 11)
11. 1.7V Limiter In (diff pair base)

12. 1.7V Limiter DEC1 (diff pair base)
13. 1.6V I.F. Out
14. 1.6V DEC2 (35k pair emitters, 15k pin 15)
An external resistor from pin 14 to ground should
lower the gain of this stage turning it into an amp
rather than a limiter. Perhaps a manual gain control
potentiometer could be wired here and pin 10.
15. 1.6V In (diff pair base)
16. 1.6V DEC1 (diff pair base)

</pre>

you only need a sheet of cardboard size A4 with - say 10-15 turns and
a link of 2 turns, the larger size you use reduce turns

I used one construction covering 500-1500kHz with Mosfet amplifier and
later found that it was perfectly OK to use only a link for many
purposes like 80 or 160m

If you make the frame large enough you can put an AM broadcast
receiver inside the frame and will discover that the frame amplify the
signal when tuned to desired frequency

> my long life, I laugh at that.

He keeps talking about the current, you keep harping about the voltage - if we're talking about the lethal amount of electricity, voltage has got nothing to do with it and your statements are non sequitur. The fact that you got zapped from 120VAC and I got zapped by 220 and 120VAC many times is completely irrelevant - in both of these cases the amount of current flowing through our hearts was not sufficient enough to defibrillate it. That kind of folklore, however, does not justify irresponsible handling of dangerous voltages. And yes, it is voltages in this case, since the current through our bodies pretty much follows the Ohm's law. The problem is that it is impossible to say "don't handle sources that will pump over 25mA through your heart" since that current depends on a variety of factors, from the person's weight, fluid intake, perspiration, to the voltage, frequency, path of the current, ground insulation, length of exposure, etc.
The bottom line is that the household voltage, either 120V or 220V is unsafe because it can be lethal under many circumstances. The fact that you survived touching it does not make it any more safe than the fact that many people survived playing Russian roulette.

> People get struck by lighting and survive, so
> fear not your electrical outlet.

This is such a nonsense that it almost doesn't deserve commenting. First of all, nobody survives after being "struck by lightning". One may survive an indirect hit a few dozen feet away or so, but being hit with a direct hit from the source of hundreds of million Volts kills a person flat out, not by defibrillating the heart (as the 120V would likely do), but by instantly cooking the vital organs, including the brain. According to this logic, we can safely stand in the bathtub full of water and grab the hot wire in the nearest electrical socket. After all, it is much less than a lightning.

> > AC power can also have the effect of fibrillating the heartbeat, and 60Hz

> Edison's DC system of supplying homes with power.

This is a strawman argument. Edison may have done that (while conveniently forgetting the fact that the same amount of DC kills just as efficiently as AC), but it's got nothing to do with the biological and medical facts.

> Telsa would play with AC and high voltage devices all his life, said they were
> healthy, and lived to a very old age dying in his sleep, not of any cancer.

And this is the argument from authority. Tesla said AC was healthy - it must be healthy!!! Not to mention that again you built up a nice non sequitur strawman - nobody mentioned cancer to begin with.

> > than a wake-up jolt; yet an old book on telegraphy asserts that one

>
> Do you know how many AMPS you can get from a car battery? Ever try grabbing
> one hand on each post of a car battery to see what happens? Absolutely
> nothing.

First of all, no one claimed that the car battery would kill you. Second, the ampacity of the car battery is irrelevant. Third, the fact is that under the right conditions (admittedly, very bizarre and extremely rare conditions) 22.5V *can* be hazardous. It is considered, however, that voltages under 50V are safe to handle.

Yet you feel compelled to deny it first, almost encouraging people to wander around during thunderstorms and to use a hairdryer while showering. Whatever.

6935. Re: Cardboard Box MW antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-09 23:40:41 UTC
From: amdx <amdx@att.net>
Message-ID: <ZPZG7.105804$WW.6183179@bgtnsc05-news.ops.worldnet.att.net>
Source record: 48783

The optimum inductance depends on the frequency and the capacitor.
The usual values for the AM broadcast band are 240uh and a 365 picofarad capacitor. An average 365pf air variable capacitor will have a minimum capacitance of about 20pf.
The formula for resonance is
Frequency =1 / 2 pi sqrt L C
Example: 1/2 x 3.14 x sqrt 240uh x 365pf =Freq. of resonance
1/6.28 x sqrt .00024 x .000000000365=Freq. of resonance
1/ 6.28 x .000000296
1/ .00000185888
538,007 hz
So the lowest resonant freq. would be 538Khz

If you run the math you will see the highest freq is 2,298,365hz using 20pf as the minimum capacitance of the capacitor.

Now to complicate things you will not reach this frequency. The reason is, the coil you make will have capacitance between the turns, this will add to the air variable you use. Let's assume the coil you wind adds an aditional
20pf to the air variable capacitor. Now you have 40pf, if you run the math on this you will find a resonant freq of 1,625,192 hz. Now you say, but I want
to reach 1700Khz, at this point you could squeeze the turns together to adjust
the inductance so you could reach the upper freq.
That's enough for now, got to go, let me know what's happening.

Mike

Sorry to sound like a scold, but any representation that line power isn't lethal stuff is more than nonsense, its DANGEROUS nonsense.

I'll agree with that! What ever adjective you want to put in front of it is
fine.

++++++++++++

Just for info : At least in the UK and probably other countries as well , in industry , isolation transformers 230 ---> 110 V are used for portable tools ,with the secondary winding having an earthed (US terminology : grounded) centre tap.
This means that in case of equipment or cable failure the max voltage to earth (ground) is 55 V, which is considered SAFE ,eg does not constitute a risk of electrocution.

Source record: 48788

Hello--

You can use an 18-inch diameter wooden embroidery hoop and a length of 16-conductor
ribbon cable to build the loop. Terminate the ends of the ribbon cable such that
the start of one turn connects to the end of the previous turn. Use 15 conductors, and
the 16th conductor becomes an electrically-isolated one-turn coupling winding that's
helpful for connecting to a receiver's low-impedance antenna input.

To tune the loop, you can use a two-section variable capacitor scrounged from an AA5
along with a SPST toggle switch to connect the oscillator capacitor's plates in parallel
with the main capacitor for extended low-frequency BC band coverage.

The ribbon cable makes a neater (i.e., more uniformly-spaced) winding than does hand winding of a single strand of magnet wire. And if you use 16-pin DIP mass-terminated plugs on the ribbon cable's ends, you can easily build a simple PC board (or even wire-wrap one) to make the turns' crossover connections.

One more design fillip: if you opt for a single-turn coupling link, you can add a common-mode
RF choke to the line connecting to thr receiver's antenna and ground terminals. The CM
choke minimizes hand-capacitance effects on loop Q and tuning.

A large loop antenna (regardless of design) runs rings around the typical loopstick antenna
commonly used in AA5s and transistor radios. You'll be amazed at the loop's improvements in receiver sensitivity and selectivity-- just position the receiver near the loop, and tune for maximum signal. You can rotate the loop to null an interfering station or peak a
desired station.

Your knowledge of simple electronics is quite amazing. Never has one
person provided such a compilation of mis-information and
mis-understanding.

You can't get any AMPS from a battery unless there is a finite resistance.

Current through a body is determined by the resistance of the path. If you have a 12 volt potential and tests show that .025 Amp can kill, then R=12/.025 or 480 ohms. Less resistence = MORE current = More certain injury. For 110 VAC, 110/.025 = 440 Ohms. This resistance is quite possible for a path through the human body.

If you need further proof, I suggest you connect one side of a 110 V line to a bucket of water, Stand in the bucket and grab the other lead of the 110 source with your hand. Film at eleven (Darwin awards) Services on Saturday.

Marital problems? Toss your wife's hair dryed into her bathtub whilst she in basking therein. OOOPS. I didn't know the thing was loaded.

I don't think that old trick works anymore, for years hair dryers have
come with a built in GFI at the plug end of the cord.

That is true. The reason people survive is generally their skin has
high resistance but the internal organs do not. So for someone to
take a lethal shock they have to have conductive skin at the entry
and exit paths.

> less than a lightning.

Wrong.

People survive lightning strikes -- direct lightning strikes -- all
the time. Being in the Front Range of the Rockies, climbers get hit
all the time. Some die. Many do not. Those that don't get truly
memorable burns. Those that do die die because of the heart
fibrillation, not "instant cooking of the vital organs." The actual
amount of energy in a lightning strike is relatively low -- it is
just delivered over a very short period of time.

Having had these arguments before I can give you direct citations
if you are willing to listen to an opinion other than your own.

Wrong again. The higher the frequency, the more lethal
the current is. I don't know why. Do you have a ham license?
Do you remember anything about the RF safety/RF burn issue?

That's not to say that DC is safer -- it's just dangerous in
different ways. Breaking a DC short circuit is harder than
breaking an ac short because there's no zero-crossing to make
a nice interruption of the arc.

Agreed. Non-sequitur. "My great grampa lived to 133 and smoked 5
packs a day, therefore cigarettes are healthy." Not hardly.

But if he got a low resistance path through the chest it could
possibly be lethal. Some people have more conductive skin than
others. I can get a nasty shock from 24 volts. An electrician
I knew as a child had exceedingly dry skin -- he tested 120 volt
circuits by licking his fingers and putting them across the circuit.
240 volt circuits didn't require licking his fingers.

If you want to see a low resitance path across a battery and
see how much current it can deliver, drop a wrench across a car
battery. Hint: Wear safety gear and a rubber lab coat, and
be prepared for splattering acid.

I think he's agreeing with the use of the word "nonsense" and a
deliberate misparsing of the sentence.

Me, I think you guys both are off the deep end a little here.

The original guy was talking about tying a 0.01 uF AC cap from
the neutral to the lamp frame. Failure of that cap, combined with
a miswired house, would cause a potential safety hazard. Yet that
cap arrangement is done all the time. Take your Sony TV. Disconnect
it from the cable system, the satellite, the stereo/AV system --
isolate it. Now measure the voltage from the cable/antenna
shield (on the F connector) to ground. Surprised? That's 'cause
they have two caps, one to each side of the line, just as described
above. Yet UL approves. (I wonder if that arrangement is also
there on CE approved versions.) I know this because I am so
sick and tired of ground-loop-induced hum in my A/V system
because of this. I have to ground the shit out of everything
to get rid of it. At my old apartment the cable system wasn't
properly grounded -- big surprise -- and I had to use an
RF isolation transformer to get rid of the problems caused by
the cable system floating well above ground.

Hello,

I am in need of some help.....
I have an SMC 2520 Band 3 radio and I am looking to convert it.
Has any one done this with one before ?
if so what did you do and on to which band ?
Also has any one got a manual / circuit details and or an
address for Argyle communications whom I believe had some thing
to do with the design / programming of the rig..

Message-ID: <uIaH7.101826$ez.12983673@news1.rdc1.nj.home.com>
Source record: 48803

this was in the Electronics World "Circuit Ideas" section -- the voltage control source (0-5VDC) is connected to a LED through a ballast resistor. The LED itself is placed on a TSL230 Light to frequency converter.

You can square up the pulse-train with a 4027. The TSL type devices are now made by TAOS, Inc. who bought the line from Texas Instruments.

6955. Schematics Programs/Templates

Thanks to Willis, Greg Beat, and Mark Keith for constructive comments.

My guess also was that the previous owner simply used too much drive at
some point, or perhaps somehow got the amp to oscillate.

Well, another local ham happened to have several resistors of the right
ratings, so I went ahead and put them in, and the amp seems to be fine.
Power input is a bit low on the 15-meter band, but I hope that'll be
fixed with a little tweaking, which I'll do this weekend.

Howdy Cliff....I'll be looking for replies to your query as well...but in the meantime, I'll tell you that all my schematics (which won't fit into say Electronics Workbench) such as tube type etc I draw using old Microsoft Paintbrush....I've tried a bunch of different drawing/cad programs and keep coming back to Paintbrush for its ease of modifying and "easy" ability to detail at the pixel level (Paintshop will do this as well but not nearly as easily). Very easy to add text and notes as well.
..files store in .bmp format which isn't the smallest but can be zipped if need be (like many). I could likely send you a sample drawing....maybe you could use it as a cut 'n paste file to build your own library.

Not sure about 572 tubes--but blown grid resistors could indicate a VHF
parasitic oscillation and related arc-over damage.

Hi Joel
Thanks for the reply. Ihave been out of rf for many years and I am
starting out again. I might even get my ham license again.
I had a couple of issues with a modification to the receiver board
instructions and I had to pry the information out of the author so I
am trying this newsgroup for possible answers to this issue.
The uhf and super uhf have a connection going to the cable tuner
prescaler for frequency readout purposes. The tracking generator also
picks up rf from the cable tuner swept oscillator. The prints show the
same connection point in the cable tuner. One page in the book I
bought with the modules shows the two uhf tuners connect to the input
to the prescaler and the tracking generator coax is connected to a
different point in the cable tuner. The page is 4-107 user feedback,
from Donald Rees. If you have the book you can see what I mean.
The tracking generator comes with coax connected to it. I have to hook
the coax up to the cable tuner.
I have double clad pcb boxes and rf connectors, plus a lot of 174 coax
and feedthrough capacitors.
We can probably switch to Email so as not to clutter up this
newsgroup. Let me know.
Thank you.

> just delivered over a very short period of time.

Oh, please... Have you ever seen a tree split in half by lightning? How about fulgurites (glass tubes) on a sandy beach produced by lightning strikes melting sand at about 12,000 degree Fahrenheit? Those effects cannot be made by a source of "relatively low" energy. Whoever was hit by a lightning and survived, most likely was hit by a stray weak(er) streak from the main path of the lightning. An average lightning releases about 250 kWh (that's kilowatt hours) of energy. The fact that the event is brief (a few ms) can be used in a simple mathematical calculation which will show that the amount of *power* released in those few milliseconds is enormous. The current flowing through the lightning bolts is in the order of tens of thousands of Amperes and the temperatures within the main bolt can reach over 50,000 degrees Fahrenheit!
No one survives a direct hit by lightning! If a lightning bolt hits you directly, your body will be cooked instantly. You *may* have a chance if you are hit with a streak from the main bolt (by far the most common case) and that streak happens to be relatively weak.

> Having had these arguments before I can give you direct citations

> the current is.

Are you kidding me? You might want to look up "skin effect" and other phenomena.

> I don't know why. Do you have a ham license?

What's that got to do with anything? And yes, I do - a simple scrolling down to the bottom would have revealed it.

> Do you remember anything about the RF safety/RF burn issue?

RF burn is a completely different effect. You can have much more current flowing through your body in RF frequencies than the 50/60Hz current, yet nothing would happen except a varying degree of skin burn. Due to the skin effect, almost no electrical current flows through the body, but only through the skin. The skin effect is proportional to the frequency. Therefore, the statement that "The higher the frequency, the more lethal the current is" is clearly nonsense. That is not a license to handle high frequency sources like candy, but simply to be aware what the hazards are in what particular situation.

> That's not to say that DC is safer -- it's just dangerous in
> different ways.

There is no much difference between the DC and 50/60Hz, except for the biological fact about the heart valve palpitation timing which is fairly close to the household voltage cycle.

> Breaking a DC short circuit is harder than
> breaking an ac short because there's no zero-crossing to make
> a nice interruption of the arc.

Fine, but what has this got to do with what we're discussing.

> Me, I think you guys both are off the deep end a little here.
> The original guy was talking about tying a 0.01 uF AC cap from
> the neutral to the lamp frame. Failure of that cap....[snip]

I was purposely not addressing the issue of this method. I simply wanted to point out the fallacies of the unfounded, illogical, circular and backward reasoning, which in this case might make a difference between someone's life and death. But if you can show me in what point I was off the deep end, I'd be much obliged.

The circuit diagram for the one on my website is in the ARRL handbook.
Its quenching isn't exactly external, it has a source tuned circuit that
does the quenching, while the drain tuned circuit is the RF end of the
business.

Around the net I've not seen many other designs, almost all are self
quenching. Spoiling the regenerative stage to the tune of an external
oscillator can't be too hard?

wrote:
>if there was anything drastically wrong with the HTML
>then it would not work with IE5 so I am reluctant to tinker with it.
>Need expert help.Can anyone point me in the right direction

Doesn't work for me either, either with Opera 5 or Netscape 4.71. I use
Linux so switching to IE is not an option.

The problem is with the Javascript used in the "OmenTree" menu. Apparently
it uses some Microsoft-specific functions. There's another way of doing it,
attached. This method is probably not the only way to do it, other methods
may be more attractive as well.

On a vaguely related subject, you might want to reconsider having a
"mailto:" link. The spam crooks run automatic harvesters which look for
email addresses on web pages and put them on mailing lists for pornography
and scam advertisements. Making an *image* containing the text of your
address (Microsoft Paint works fine for this) and putting that image on your
site is a safer idea. (see mine)

Here's some HTML source which I think will do what you're trying to do and
still work with *all* browsers and OSs.

6971. 915MHz FM ATV component level design - TX & RX

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-10 21:26:07 UTC
From: markaren1@earthlink.notalotofspam.net
Message-ID: <3bed98c8.332969895@news.earthlink.net>
Source record: 48822

Hi all,

I am in the process of tinkering with an FM 915MHz video link.

TX is based on a VTO-9080 VCO + Preemphesis + Video buffer, PA will be a Hitachi PF0031.

RX is based in a Ku band RX IF section tuned down to 915MHz with a masthead preamp.

Before I commit to PCB with this design I am interested in similar designs for FM ATV on WWW pages - I haven't had much sucess so far finding many apart from:

PE1IPD http://www.dutch.nl/bdj/ in Holland and F6KEH http://f6keh.free.fr/f6keh%20ressources/menu_e.htm in France have done some interesting work (many thanks both of you).

I would be gratefull for any published 1.3GHz designs which I could adapt - or at least steal lock stock and barrel :)

I am also intersted in PCB Microwave design software which allows analysis of PCB couplers - preferably shareware. I have a copy of PUFF but it is rather hard work.

This is not a commercial project.

Please also reply by email - my address needs de-spammification.

Thanks,

Mark.

I have been looking for decent FM tuner cards,but can't seem to find
any.Could u point me to manufacturers/websites?
Maybe I'm just not looking right.

Thanks!

Over 200. The only reason you can grab the terminals with bare hands and not have a problem is the voltage is to low to overcome skin resistance. Go for a swim, get out and grab that same battery while you are still wet. We will wait a couple of days to give you time to complete the experiment. When you do, come back and tell us what you learned (if you can). I once built an arc welder that ran off batteries. One jeep battery (24 volt) or two car batteries and you could weld 1/8 inch steel quite well.

What OS do you use? Any good vector drawing program will
do the job. I use Xfig or Kontour for Linux. Both are
Free and open-source.

Smartdraw for Windows is pretty good. ClarisDraw for the Mac....

This must not be very common practice. I am a woodworker and correspond with lots of UK woodworkers. Something that comes up all the time is voltage of tools. Many have expressed a desire to buy tools while visiting the US (because they are substantially less expensive here) but have the concern over the voltage difference. If what you say was that common, they would already own the transformers necessary. I'm not saying that it is not done, just that it is not standard practice. As far as 55 volts being safe, I doubt that anyone of any authority believes this to be true. The term is probably "safer".

why don't you save as gif? My win95 and win98 versions easily save as
gif with just one stupid measure from Bill, but just forget about his
stupid ideas. Today downloaded symbols from
http://www.arrl.org/qexfiles/ the file
Schematic bitmap symbols from QST Hints and Kinks
they seem to be arranged for paintbrush, but I use powerpoint and the
symbols couldn't be transferred easily, so I make my own symbols and
copy from one circuit to another

It is easy to draw in powerpoint and save as gif, but if you will make
later changes you must also save as ppt

Take a look at Eagle (http://www.cadsoft.de). It is a package for schematic drawing and PCB design. It is available for Linux and Windows. The basic version is free (restricted to one page of schematic diagram). The commercial versions are not too expensive.

If you run Linux (I hope you do ;-D) then you may also want to take a look at XCircuit (http://bach.ece.jhu.edu/~tim/programs/xcircuit/).

Xcircuit is fairly good for electronic specific stuff.

The Xcircuit site has tube libraries available for download.

Yeah, but you need an X Server to do it.

And for best usage you really need a true 3-button mouse, most Win32 X
Servers do that really poorly. Other than that, I love XCircuit, I use
it for all my electronics stuff.

Why is it we have to soak ourselves in water before working with electricity before you can somehow
prove a point that it is dangerous? Should we put some SALT in the water first and have someone shoot
a gun to our heads as we work around electricity so you can be REALLY right?

From someone who never turns the circuit breaker off when changing a light switch or dimmer, or unplugs
a radio or vcr before working on it, I have been shocked with the AC hundreds of times and it doesn't
even make me jump anymore. You can preach all you want, but you are NEVER going to convince me that
it is dangerous because I know from experience that it isn't.

Of course I don't do these things in the shower as you somehow are obsessed with.

I have to agree with Doug here.

I'd love to take a look at the site, but the navigation pane requires stuff that my browser (NS 4.7 under linux) doesn't support. The JavaScript driving the DHTML in the nav is actually fairly elegant, its a shame it isn't written with portability in mind as well.

Perhaps you can contact omensoft (their URL in the code doesn't work for me) and ask them to fix it? If you can't I'd be willing to have a crack at fixing it.

You might just opt for a dumb flat nav system, or one that is just like the current one, but flatterned into several pages (one for each 'FolderNode').

It doesn't work if it is running at the time either, it just sits there and churns water. The motor and heating element are much better paths for the current to take than through the water and into the drainage piping. Sure you get some leakage and it will pop a RCD/GFI but it probably wouldn't kill an adult in the water, one not touching the drain wouldn't even feel it either.

However, if it is turned off at the unit, but on a GPO, that is an entirely different situation.

> (glass tubes) on a sandy beach produced by lightning strikes melting sand at about 12,000
> degree Fahrenheit? Those effects cannot be made by a source of "relatively low" energy.

Yes, they can. The key words are "energy" and "relatively." It's a
high amount of power (energy/time) but low energy. According to

http://www.weatherwise.org/qr/qry.lightningpower.html

Which has the clearest description for those who need small words,
"The energy input in a typical 3-mile long lightning channel is
estimated to be one billion to ten billion joules. [One Joule is
one watt-second.] One hundred joules of energy will keep a 100-watt
light bulb going for one second. One billion joules will keep the
light bulb lit for 116 days." (References on that page.)

That's not all that much energy, relatively speaking. Release it
over 30ms, (IEEE 8/22 lightning profile) however, and you do have
a huge blast of *power.* The reason the trees explode and
the fulgerites form is that tree sap and fulgerites are poor
conductors, becoming the "weak link" in the circuit. The sand

melts; the water in the sap explosively expands when it boils.

> Whoever was hit by a lightning and survived, most likely was hit by a stray weak(er)
> streak from the main path of the lightning.

No. See below.

> An average lightning releases about 250 kWh
> (that's kilowatt hours) of energy.

Actually slightly higher at the bottom end, but it still doesn't
matter.

> The fact that the event is brief (a few ms) can be
> used in a simple mathematical calculation which will show that the amount of *power*
> released in those few milliseconds is enormous. The current flowing through the lightning

> No one survives a direct hit by lightning!

Suggest you watch your local news on stormy days. Direct strikes are
common on soccer fields. Gary Coffman in r.r.a.antenna refers to a
PGA player (Hale Irwin?) who has been hit twice, on camera both times.

> If a lightning bolt hits you directly, your

>
> Please do. Testimonials will not count, btw, only scientific observations and data.

From when I got into this argument last year, I basically collected
info over a three week period. Here is that info:

10-July-2000:

In Boulder today a 9 year old boy from Texas was hit by lightning
and is now in Denver Children's Hospital in critical condition.
He's alive because a bystander administered CPR. For Boulderites,
the strike occurred on Panorama Point off Flagstaff Mountain Rd.
Two other children had minor injuries from "flying debris" and
were treated and released from Boulder Community hospital.

I suppose you could call them to try and wangle out details if
they'll let you have them...

There are also numerous grass fires burning due to lightning from
these storms.

10-July-2000:

Follow up... John Albeter, 45 was struck a couple of days ago. He
was showing his burns off on KCNC-4, the local CBS affiliate. They
claim that at least 3 people have been hit and survived "in the last
few days."

Unfortunately, their web site is intentionally kept out of date as
compared to the broadcast info, so nothing is there, yet. But try

http://www.kcncnews4.com/

Later this week or consider getting a copy of tomorrow's (Tuesday's)
Rocky Mountain News (which shares stories with KCNC).

18-July-2000:

Follow up... because of the storms we have had over the last few
days, there have been a lot of strikes. KCNC-4 in Denver reports
that 9 people (including the above) have been hit, with only 1
fatality. One couple who were hit actually hiked to get help
for the burns on their legs (ouch!); the dead individual was
climbing a mountain when he was hit -- the rescue/recovery
crews needed a couple of days to pick up his body because the
lightning was too dangerous for them to go get him.

Bottom line -- lots of lightning survivors, and the single
fatality didn't get himself blasted into tiny fragments.

(I stopped collecting data at that point, given I'd made my
point in 8 days.)

There's even a survivors' support group:

http://www.mindspring.com/~lightningstrike/

Since you don't want testimonials -- a reasonable thing --
you might want to skip to the "links" section and follow
the one put there by the MD. I haven't explored them since
last year, so I don't vouch for their quality.

Suggest you look up medical information on current necessary to stop
a heart at DC, 60 Hz, 400Hz and 1kHz. I may be totally out of line
on RF, but I do know that *up to a point, well within the frequencies
we are talking about,* ac is more lethal than DC.

Well, because you seem like a smartass, and so I felt I should explain
why DC can be dangerous in a different way. Next time I'll remember
to put "but I digress" on that part of the message to avoid the other
obvious smartass answer.

> > Me, I think you guys both are off the deep end a little here.
> > The original guy was talking about tying a 0.01 uF AC cap from
> > the neutral to the lamp frame. Failure of that cap....[snip]
>
> I was purposely not addressing the issue of this method.

Why? That was what the thread was all about? People bitch about
topic drift all the time, and instead of helping the guy, you
continue on a tangent? Dumbass, not smartass.

> I simply wanted to point out the
> fallacies of the unfounded, illogical, circular and backward reasoning, which in this
> case might make a difference between someone's life and death. But if you can show me in
> what point I was off the deep end, I'd be much obliged.
>

I was not able to give as complete a reply as I wanted. I would
suggest getting a copy of "The 'Grounds' for Lightning and EMP
Protection' published by Polyphaser corporation. They do
professional lightning and NEMP protection. People who use
their products properly (like many -- but not all -- radio and
TV stations) stay on the air while their towers are being
pounded. The Joule-rating of the supressors is surprisingly
low (their resistence when conducting is very very low).

Suggest also that you use your favorite usenet search engine
to look up any posts by Gary Coffman in rec.radio.amateur.antenna.
He's an expert -- a real one, not a wannabe -- in the field.

I will quote some of his postings in their entirety to spare
you the trouble of working on this:

When one of the 33 ohm resistor is blown, it was because the 572B tube
grid shorted out to the filament. The grid resistor disappears with a
shotgun blast noise (happen to me three times). So replace the band
tube and 33 ohm resistor and, more than likely, normal operation will
be restored - good luck Pete (W8UXD)

The 6146 was introduced by RCA in 1951, as a replacement for the 2E26 transmitting tube. It allowed you to crank-up the output of a transmitter (one using a 2E26 of course) without any modifications; you simply remove the 2E26 and plug-in a 6146! The 6146 could be used in the 2 meter (144 MHz) and 220 MHz VHF bands with reduced output. In the '50's and 60's, it was also used as finals in hi-fi audio amps, PA systems, and guitar amps.

The hi-fi version of the 6146, the 6550 (a.k.a. KT88), was later introduced for safety reasons (dangerous plate cap on the 6146) and is quite popular in hi-fi today. The 6550 is also used as a transmitting tube, though not as popular as the 6146. I have seen both 6550's and 6146's in illegally built radio jammers and CB radios.

I have it and I think it is pretty good. I prefer Xfig.
It has a similar look and feel and IMHO is a more powerful
program. It has a fairly basic electronic component library.

Most of my schematics were drawn with Kontour/Killustrator -
see URL below.

Yes, relative to a nuclear explosion, say, or a volcanic eruption, it's not much. But if a 100 kg (220 pound) man absorbed a billion joules, it would raise his temperature by 1100 degrees C (1900 degrees F). As far as the person is concerned, there's no practical difference between the energy in the lightning strike and the energy in a nuclear bomb.

Message-ID: <9sllurroe1@wanadoo.fr>
Source record: 48846

Alan , Geoffrey,

Thank you for answering my message.

I have built the ARRL circuit using a JFET. An untuned FET isolation stage has been added for antenna coupling.
The output circuit has been modified to increase the AF level: the 12 k resistor is replaced by the winding of a small AF transformer (value not critical).
Regeneration control is better with a 10 pF adjustable capacitor between source and drain than with the 25 k pot .

It works fine to listen to AM and wide FM up to 400 MHz, sensitivity is good but bandwidth is too large, it could probably be significantly improved with a circuit using an HF filter like SAW.

I have also tried different circuits for external quenching, the problem is to find the optimum quenching wave envelope pattern.

Best regards.

Thanks for that info, I'll have a fiddle with mine.

400 MHz, wow, what FET did you use?

I used a MPF102 and it clapped out around 270 MHz.

One can only hope that no young experimenters take this liers advice at face
value.
His knowledge of electricity and its effects is nil.

The 120 volt receptacle in your house is dangerous. No exceptions !

To Steve: Go back to scholl and learn something before you post any
more lies to this group.

Far out!

I've got it fixed (for now, at least), but I'll make a note about this
in the manual. The "bad" resistor was indeed completely gone.

Thanks, Pete.

7002. Two coupled coils

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-11 14:15:40 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9sm159kv1@uranium.btinternet.com>
Source record: 48700

New program TWOCOILS.exe

Design two single-layer solenoid coils, magnetically coupled, and position them for a required coupling coefficient and mutual inductance. Coil inductances and values of associated tuning capacitors are calculated. Program is applicable to PA tank circuits, interstage couplings, unbalanced-to-balanced impedance-matching networks, antenna tuners, etc.

Can be used for quick design of individual solenoids. Enter dimensions in mm. Results shown in inches and AWG

To complete the picture the guts of this program need to be built into particular application programs. I'm thinking about it.

Download TWOCOILS, one file, 38 kbytes, in a few seconds from website below.

I could not find an appropriate news-group for my question, but I am sure that homebrewers are universal DIY people, so perhaps someone could help me.
I have a Samsung SyncMaster 900IFT monitor for my PC. Recently the anti-reflex protective layer on its screen has started to dissapear at places, so I must remove the whole layer now. I have tried my whole home collection of cleaning and melting liquids, but with no result. Does anyone know what kind of chemical should I use?
Thanks. Bozidar, 9A2HL

Sorry, Roy, while I have respect for you and Tom W8JI, you are both dead wrong on this subject. There is too much actual, existing empirical evidence for you to study if you are willing to open your mind to it with regard to this subject. In my previous posting I gave references for you to follow up. I can't force you to do your legwork, but the references are there, and you can follow them up if you are willing.

Parts for Sale as of 11/11/2001
==========
NEW .1 uF Poly/Film caps - 10% 250v, new stock, paper tape, nice long leads.
These are not NPO and are made by S&M Components

50 for $3.00 or 100 for $5.00

22uF 35v electrolytics - $2.00 and 2 stamps for 100 These caps are on paper
tape, NOS (New, but old stock) made by Richey.

I have NEW BNC chassis connectors for (includes nut and lock washer)
==========
25 for $14.00
50 for $24.00
100 for $40.00

Voltage Regulators
==========
LM7805C voltage regulators. TO220 case. 5 for $4.00
L7806CV voltage regulators. TO220 case. 5 for $4.00
LM7808CT voltage regulators. TO220 case. 5 for $4.00
LM7812T voltage regulators. TO220 case. 5 for $4.00

3 of each for $10

Transistors
==========
2N2222's in METAL TO18 case - 25 for $7.50 NEW PARTS
2N3906's plastic TO92 case - 50 for $4.00 NEW PARTS

Crystals
==========
3.579545 Mhz Crystals for 80m - These are pulls, $1.00 each

POTS
==========
10K 1 Turn Panel mount pots. These are pulls. No knobs, just shafts. Most
are Allen Bradley. Pot is about as big as a quarter. With nut. 5 for $4.00

Diodes
==========
1N4148 - You always need these. 75 for $2.00 These are NEW.

Speakers
==========
Little 3 inch PC speakers, 8 Ohm. $1.50 includes shipping in a padded

envelope. 10 for $8.00 - They work great for little external speakers on QRP rigs.
Just add a audio amp you make from 2N3906's and you can run your neighbors out of their house.

Let me know if you're interested. All prices are post paid to the USA, unless otherwise noted. I will ship to non USA addresses but we need to discuss the shipping charges first.

Thanks - My address on QRZ is good.

OT Question if I may?

That blue PCB material on a few of the images on your site, do you
paint it that colour, or is that the natural colour of the substrate?

"Mark Atherton" <markaren1@earthlink.notalotofspam.net> a &#65533;crit dans le message news: 3bed98c8.332969895@news.earthlink.net...
Hi all,

I am in the process of tinkering with an FM 915MHz video link.

TX is based on a VTO-9080 VCO + Preemphesis + Video buffer, PA will be a Hitachi PF0031.

RX is based in a Ku band RX IF section tuned down to 915MHz with a masthead preamp.

Before I commit to PCB with this design I am interested in similar designs for FM ATV on WWW pages - I haven't had much sucess so far finding many apart from:

PE1IPD http://www.dutch.nl/bdj/ in Holland and F6KEH http://f6keh.free.fr/f6keh%20ressources/menu_e.htm in France have done some interesting work (many thanks both of you).

I would be gratefull for any published 1.3GHz designs which I could adapt - or at least steal lock stock and barrel :)

I am also intersted in PCB Microwave design software which allows analysis of PCB couplers - preferably shareware. I have a copy of PUFF but it is rather hard work.

This is not a commercial project.

Please also reply by email - my address needs de-spammification.

Thanks,

Mark.

I had a SB200 quite a few years ago(circa 1975) that alos blew one of
the grid resistors. I replaced the resistor and the amp ran fine - there
was no tube damage and the amp had never been over driven. That amp was
used for many more years under some rough conditions. I gave it to my
Dad and he kept it in the toolshed in Florida. Over time I replaced the
HV power supply diodes and the meter multiplier resistors for HV. I
understand the latter is a common problem; probably the original parts
were under-rated. Reading this thread, I wonder if that was also true
of the grid resistors.

The early Ampeg SVT bass amps are the only ones I am aware of which used 6146's, and they were later changed to 6550's..

> The hi-fi version of the 6146, the 6550 (a.k.a. KT88), was later

Unless you have a Peavey Roadmaster guitar amp head, where the factory wired pin #1 as a B+ tie point. I've seen two of them done that way, and on the first one I found out the hard way to the tune of, I think it was 600 vdc across my little finger, cuz the stainless ring around the base of the tube is tied to pin +1 which is supposed to be grounded..

> The 6550 is also used as a transmitting
> tube, though not as popular as the 6146.

Yup, 6146's are used in many of the old tube rigs, including my old Heath SB-101's and now in my Collins KWM-2. Fortunately, I have a few NOS 6146's to last me for a while..

In L. Meulstee excellent book 'Wireless for the Warrior, vol .2' you can find extensive information about the WS38 (more than 20 pages) If you just want the circuit diagram, I could scan it and send it to you by e-mail.

I should add that the 8552 (I think that's the number) was a 6146
with a 12V filament.

Thats the colour of the PCB. I got it from a local supplier that
made blue PCB for IBM, way back in the old days when IBM used PCB.

Nice! Now it works.

One suggestion: it may be a good idea to convert the jpg files into pdf files. One pdf file per project. It would be a little easier to handle this way (especially for printing). I converted "singletran" and can send it to you if you want to take a look. I could also convert the other articles if you want me to.

And something else. If you scan more pages then please don't save them in jpg format. Use a losless format like for example png or gif, or save jpg in lossless mode. jpg is not very well suited for written documents, at least not when used in lossy mode (text "smears").

Make that no current. The "Van de Graaff" generates a static charge.
The person is standing on a insulated platform.

The generator is turned off and discharged. Then the person on the
insulated platform places his hand on the upper sphere and keeps it
there. The generator starts raising the potential of the upper sphere
and the body of the person in contact with it.

The generator is shut down and discharged before the person removes
his hand from the sphere.

Get a grip people.

120 VAC *is* lethal. Period. Not always, but often enough.
Lightning is lethal. Not always but often enough.

Geeze, this is beginning to sound like one of the operating system dick
wars.

My first experience with 120 VAC was when my dad was remodeling the
kitchen back in 1965. He said, pointing to the wires hanging down where the
wall switch used to be, "If you together, the light comes on." Well, I
did, one
finger and thumb on each wire. Holy jumping Mary. The second time I held
on to the insulation.

I've been working with electrical and electronic equipment since about
1967 or
so. And I've been bitten by a variety of things. AC, DC, high voltage,
RF and
the ringer signal across the telephone line. All various degrees of
unpleasantness.

The below is a collection of anecdotal evidence.

An older electrician once told me, "The human body makes a great voltmeter.
120 VAC is annoying. 440 VAC knocks you across the room. 220 VAC hangs
on and kills you."

However, one of the electricians where I worked, who really should have
known
better, was vacuuming the pool at his house. He pulled the vacuum into
the pool
and reflexively grabbed it. He died.

The typical technique at the wrecking yards I used to go to for testing
a car battery
was to bounce a lug wrench across the terminals. Yeah, I know. I pointed
it out,
"I've been doing it like this for years." And eventually, he found one
with a full charge.
he's blind now.

I'm still breathing, and although my eyesight isn't was it used to be,
it hasn't been
altered by an exploding car battery.

Electricity can and will kill you. It just take the right combination of circumstances
to do it. I've just been lucky so far.

I think the key thing to keep in mind here is "Familiarity breeds contempt."

Sorry about the massive cross posting, but someone had to "Click here to check
reality."

Sorry, exactly what was it I said that was "dead wrong"? Of course a person doesn't absorb all the energy in a lightning strike, and I didn't say a person would. The purpose of my posting was to put the idea of "not all that much energy" in perspective. Although it looks from the simple minded analysis that only 1% of the energy of a 1 GJ strike, or 0.1% of the energy from a 10 GJ strike would be fatal just from heating effects, I doubt that's what kills most lightning victims. As I recall, it takes only somewhere between 10 and 100 mA through the heart to kill a person, and that can be accomplished with little energy indeed.

The premise is wrong. The person does NOT absorb a billion joules.

> The purpose of my posting was to put the idea of
> "not all that much energy" in perspective.

As was mine. People do NOT die of being cooked down to carbon by lightning strikes (at least usually -- you could maybe find one example, but not 100); they die of cardiac arrest and if someone nearby knows CPR, they usually live.

Lightning is not so immensely powerful that people never survive a hit. The odds are in your favor, actually. Ask a doctor who works in an ER.

> Although it looks from the
> simple minded analysis that only 1% of the energy of a 1 GJ strike, or
> 0.1% of the energy from a 10 GJ strike would be fatal just from heating
> effects, I doubt that's what kills most lightning victims.

It is correct that 100,000,000 J would kill the person from heating effects, but that's not how much gets released. The analysis is too simple-minded. Consider a 3 mile long lighning strike (15840 feet) compared to the 6 foot height of a man. I'm sure this is wrong, but if we assume the conductivity of the lightning path through the atmosphere is uniform, a strike on a person suggests that he is slightly more conductive than the alternate path, the last 6 feet of ionized air to the ground.

Now, measuring my thumb-to-thumb resistance, and I have conductive skin (recall I said that I can feel a shock from 24 VDC), I got 2Mohm from thumb-to-thumb. Gary Coffman asserts that the interior body's resistance is less than 1kohm. Whether you agree what that figure or not, do we agree that the interior of the body is salt-water and far more conductive than the skin?

I figured that a 1 billion joule (10^9) lightning strike could at most
release 379000 joules over that 6 foot man before side-flashing past
him for better conductivity. Of that energy, 1/2000 of it will be
released as heat in internal organs. 190 joules.

This, too, is a simple-minded analysis. It assumes the ground is
of uniform conductivity within 6 feet of the man. This also assumes
that the ionized path is of uniform resistence. Finally, and this
is its weakest point, it makes no assumtions about the energy
necessary to form the ionized path, but generally stepped leaders
aren't visible but strikes are, so I suggest it is less than that
released by the strike.

Your turn.

Ob rec.radio.shortwave:

Lightning is not an immutable force. A good lightning protection
system will save your equipment from direct strikes -- everything
that is protected, provided you do it all properly. Commercial
equipment is hit all the time. Do you really think that TV stations
in FL replace their trasmitter equipment each time their towers
take a strike? (And most commercial sites do NOT do the job
perfectly. For example, running the coax across from the tower
to the building instead of running it to the ground, across the
ground, and up into the building. One extension cord bypassing
the "ground window" protection of the mains.)

Pick up a Polyphaser catalog for free and see what a *real* grounding
system looks like. Take a trip online as well to look at their
document on ham radio station protection.

http://www.polyphaser.com/pdf/PTD1016.pdf

(Just a satisfied customer, blah, blah, blah, etc.)

> As I recall,

Jean-Franï¿½ois,

Yes, thank you. I have already stolen your CCIR405 pre-emphesis. It
works quite well.

I wish there were some more sites like yours around. Tinkering and
Homebrew seems to be an old hobby nowadays.

When I asked in one Usenet Group about component level design I was
told that I could 'throw money at the problem to make it go away" by
buying commercial equipment !

I was brought into this world to cause mischief, tinker and to learn.

What is French for Tinker ?

Regards,

Mark.

I don't find anything to disagree with in your posting. I'm far from an expert on the topic (limited to the level of converting joules to calories with the aid of a book), and found it educational.

Wow, so you might get say 380 kJ, with very nearly all of it being dissipated in the skin (since you say only 190 J ends up inside the body). That's gotta cook the skin pretty badly. I imagine, then, that even victims who survive are often badly burned.

I take it the wrench welded itself to the terminals and kept the short
going?

I've long been in the habit of checking before jumping a battery by
swinging the free ends of the jumper cables in a fast arc to justskip
across one another...always with the cables away from my face, and my
back to the connected battery.

There used to be a guy at one of the local shops who did the wrench
trick, but with a fuse-element shaped strip of tinfoil clipped to a
dowel rod instead of the wrench.

Old Tupperware lids are your friends. Find one that's about
battery-sized, and lay it over the battery whenever you're working
under the hood.

Also keeps that nasty blue-white deposit off your clothes if you have
to lean over the battery.

Hello Spyros, Lambda = 300/ freq
Units are Meter and Megacycles.
436,2 Mhz for lambd / 4 = 0,172 Meter
Mathematic it is 17,2 cm but there is a "kapacitive Load", this shortens
the length a bit.
Put a SWR Bridge between TX and Antenna (make the Antenna lets say 20cm) and
align SWR by cutting the Ant length cm by cm.

With kind regards
Guido

Lightning doesn't seek people, it seeks the ground. That's where the
other 380kJ is going.

Guido---

> Put a SWR Bridge between TX and Antenna (make the Antenna lets say
> 20cm) and align SWR by cutting the Ant length cm by cm.

I would say cut it no more than one centimeter longer than the design frequency, then cut millimeter by millimeter. A centimeter is an awfully large amount of real estate on a 440MHz antenna.

Also, there are a few other considerations to take into account. When cutting a quarter-wavelength groundplane vertical, the orientation of the radials makes a difference on the input terminal impeadance at resonance. If I remember correctly, having the groundplane radials at the true horizontal gives a resonant impeadance of about 30 ohms or so, while a 45 degree down from horizontal bend gives about 50 ohms or so. The ARRL Radio Amateur's Handbook has, for the past decade or more, had a simple groundplane vertical design shown which can be built on a chassis-mount SO-239 out of a coat hanger (or brass/copper rod stock).

7041. Re: hooking up an FM radio to a serial port

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-12 12:06:41 UTC
From: st599@ecs.soton.ac.uk
Message-ID: <3BEFBB51.22657F15@ecs.soton.ac.uk>
Source record: 48739

The serial port can't sample an analogue waveform, you'd need to use an ADC and shift register to turn your signal into PCM then use an RS232
converter to send it to your PC where you could view it in terminal. You would probably need to write some C code to control it all though.

Nice idea - hard work though

Anindita wrote:

That they do. The one example I sited -- the guy who was later
interviewed on TV, had3 or 4 4-inch diameter blisters on his
chest in a diagonal "string of pearls" pattern from each return
stroke. As they say, "that's gotta hurt."

Source record: 48648

You didn't mention just what you have tried...

It's unlikely that it's water-soluble since most screen cleaners are water based.

For organic solvents, I'd try MEK (or just acetone) but be aware that either is very likey to dissolve the monitor case. Another possibility: contact cement solvent.

If it's an inorganic coating that's been deposited, it might not be easy to find an appropriate solvent; you could try mechanical removal using a polish, but don't blame me if it results in something worse than the blotchy AR coating! (I've used Comet cleanser [with a damp rag] on my windshields for 40 years to remove road grime, and not noticed any scratching, at least not compared with what the wipers and environmental grime do anyway, but YMMV.)

All in all, I'd say there's significant probability that it will end up worse rather than better...test small areas first.

Cheers,
Tom

Right. It translates into over 250 kWh which is what I said - you even say up to 2.5 MWh - how low is that? The problem is your following statement:

> That's not all that much energy, relatively speaking. Release it
> over 30ms, (IEEE 8/22 lightning profile) however, and you do have
> a huge blast of *power.* The reason the trees explode and

Let's forget the subjective feeling about what constitutes "not all that much energy". I consider 1e9 J a hefty amount of energy, but I suppose if you compare it to the fusion output of the Sun, it is very
little. You say, however, that the reason tress explode and fulgurites form is because "they are poor conductors". Just what kind of a conductor is the human body? You can't convince me that a lightning that
will split a 100 foot tree in half will simply pass through the human body without causing much damage at all. Now, having said that, there are lightnings and there are lightnings: obviously not all of them
will be as strong as what can be witnessed during a major thunderstorm. I don't think that what most people are being hit with is a full power lightning, especially considering the fact that these seem to be
mostly hits before the storm even begins (since no one in his right mind would probably be standing in the open during a thunderstorm). However, I concede that apparently it is possible to survive a direct
hit. Fine.

> we are talking about,* ac is more lethal than DC.

Up to a point is a different story, but once that point is crossed (fairly quickly, as far as AC goes), skin effect kicks in and the only damage comes from the skin burn. You failed to mention that point
before and the only thing you said was that the lethality of AC was proportional to the frequency, which is incorrect.

> > > Breaking a DC short circuit is harder than

I don't think I'm the only smartass in this discussion. It takes two to tango - after all, you are the one who steered my post (which obviously tried to point out the ridiculous notion of HV being safe) away
from the original point to the mostly irrelevant discussion about lightnings and such. Also, breaking a short circuit (either DC or AC) in the real world situation is difficult because the short electrically
welds the conductors, and once that happens, any amount of zero-crossing is irrelevant..

> > > Me, I think you guys both are off the deep end a little here.

Excuse me, if you would for a second kindly remove your blinds, you would notice that my response (i.e. my first post in this thread) was meant to refute the nonsense of the

previous poster. My post dealt with
safety exclusively and nothing else. Now, go back and review your responses to my posts and see how on topic they are. And I'm supposed to be a smartass.

> > I simply wanted to point out the
> > fallacies of the unfounded, illogical, circular and backward reasoning, which in this

> > what point I was off the deep end, I'd be much obliged.
>
> I was not able to give as complete a reply as I wanted... [snip]

There you go again - notice who keeps drifting from the intended message of my sub-thread. Besides, the thread ceased to be on-topic (RFI from lamp dimmers) a long time ago. You keep accusing me of being a
dumbass/smartass when all the while you keep doing the very things I'm supposed to be guilty of. What has all this lightning stuff got to do with the safety with AC, DC and HV circuits? But I suppose I'm being
a smartass again? Any other insults to help your cause?

From: hexter@blazenet.net
Message-ID: <tv1arujl0pi421@corp.supernews.com>
Source record: 48652

i have found that 'hops' tend to prefer a distance of very nearly
1200 miles per bounce. So if you are 1200, or 2400 miles from a
given place, you can expect good transmit/receive operations. However,
for areas of say 600, or 1800 miles, you hardly ever get good hop
coverage. I am 2800 miles approximately from iceland, and am having
a difficult time on 20 mtrs qso'ing with my freinds there. Have you
any suggestions, like try 15mtrs or something. I suspect if I lived
in new york, and was closer to the '2400 mile' magic number I could
get better activity with far less effort.

Change antenna type or more effectively the height above ground if it is horizontal.

The "hop" distance is a function of height of the various ionosphere layers and the take-off vertical angle of your antenna pattern. The former we cannot control; the latter we can.

Good luck!

> converter to send it to your PC where you could view it in terminal.

Almost any temporary PC has a soundcard, which can sample an analogue
waveform up to 20 kHz or even more. There are software spectrum
analyzers etc. based on sondcards, too. Certain types of soundcards
contain even an on-borad FM receiver.
A serial port can process AF limited into squares. This is used in
certain communication modes (RTTY, SSTV, meteo-facsimile).

MEK is going to be difficult if not impossible to find. We couldn't get
it into my organic chemistry lab back in college.

> If it's an inorganic coating that's been deposited, it might not be
> easy to find an appropriate solvent; you could try mechanical removal
> using a polish [...]

Your proviso here is well warranted! Mechanical removal with a polish
will remove some of the glass surface of the monitor screen as well as
the offending AR coating. Because of the sheer size of a monitor
screen, however, I would suggest either having a pro do it or simply
replacing the monitor. The latter will most likely be cheaper. Comet
cleanser (or any other ``polishing'' agent that will work with any
amount of speed on a unit the size of a monitor screen) will leave
hazing that will simply drive you batty when you look at your screen.
It'll be like looking through a constant layer of dust.

Bozidar, I would suggest replacing the monitor. It will likely be
easier and less expensive.

Good luck,

Henry C. Gernhardt, III

From: arnoldg@c2i.net
Message-ID: <3bf12b2d.8848787@news1.c2i.net>
Source record: 48659

Hi,

3 pcs EF 14 Telefunken, NOS for sale. This valve is equivalent to the extremely scarce and expensive VF 14 EXCEPT for the heater voltage. EF 14 needs 6.3V, but the VF 14 needs 60V (Some Neumann mics run the valve on about 30V) The only thing you have to do is to alter the heater circuit in the powersupply of the microphone.
You can find a picture of the valves at my web site: www.demostenes.no
Just search for EF 14.
The VF 14 is extremely expensive, $ 750 - $ 1750 a piece. The EF 14 is much cheaper - only NOK 929.- each or about US$ 104.- + shipping.

Best regards,

Arnold Goks�yr

Not true. You just have to know where to look. Find somebody that builds or repairs tube and fabric airplanes, they usually have the stuff lying around in gallon cans.

Not that I'd recommend application of MEK to a monitor screen.

7064. TRADE: QUINTRON PWR SUPPLIES

Hello Fellow AM'rs
I have a number of NICE Quintron rack mounted power supplies for trade. I need Johnson Rangers or parts rigs, panels cabinets bezels; Collins R390(A) or panels covers, parts rigs; Johnson 500 parts rigs, panels, cabs, bezels, etc. Might be interested in other ba gear. I refinish the above panels & cabs so need not be beautys. Just no rust & metal undamaged.

The Quintron is capable of 2000v + @ 300ma, primary 120vac. Fully metered, indicators, safety devices, switched & is >10" high. It also has primary taps so can run @ approx 1kv @ 350ma. I'm going to use a pair of these to power AM tx, 813s rf x 813 modulators (>20" of rack space) These have been fully tested & come w / documentation. Only money considerations is shipping (its heavy) but relativily unafected by bounce & vibration.
Pics available.

Yes, all what you say is true however I and others yearn for that
broadcast quality audio something you'll have trouble achieving with a
typical QRP DSB with suppressed carrier rig.

there are pictures on the web of home-brew PWM rigs but no construction
articles other than a 40m 1Kw AM TX all in Portuguese!

A little more power than we're allowed here in the UK and a little rich
for a first timers project.

Hi Marvin

The 1N60S is quite often supplied when you order 1N34A...for a first-time user, there ain't no way to tell...even for the experienced, unless you play with different batches of them every day...altho they usually do look different (band, case colours) and are often priced differently...

OA90, OA91, OA92, [the one Bill actually meant to type, NOT the silicon rectifier, 1N92!] OA99 are the same animal...all the Germanium diodes mentioned are interchangeable with NTE109...

Don't sweat it too much, as there aren't all that many germanium diodes around these days...

Best wishes

Well, I was lucky enough to acquire some, "iron", well, HT transformers and
modulation transformer, and when I get round to building it, I'm hoping to
run a single 813, plate-modulated AM rig. 150 watts out I believe. 813
will probably be employed as RF power amp for other modes. Erm, I need my
licence first though. :c) I wonder if I can take advantage of PWM, probably.
Not
that I really know much about PWM.

Um, gee, I thought at first you might be outside the US. I have no trouble getting gallons of it at the local (WA state) home supply stores like Home Depot and Lowe's. It's a bit pricey at around $11 a gallon, but a gallon goes a long way, of course. I thought Xylene would be a bit harder to find, but Lowe's even had that in gallons at least as recently as last summer. If anything, I'd think acetone would be the hard one to find because of certain banned activities.

(Guess I'll just "agree to disagree" on the thought that Comet would leave the monitor hazy to the point of driving one batty. My experience with it on glass windshields over many scrubbings over a period of years just doesn't support that. But...I did warn that his MMV. ;-)

Cheers,
Tom

This posting is on behalf of Arthur, VE3ZV. Could anyone help him with the information he is looking for? If so please email him, not me, at the address shown at the end of his posting...

Many thanks,

Peter, G3PHO

.....

Hello,

I have been unsucessful in obtaining information (identification & data sheet info) on the following items from mailing lists to which I have submitted requests.

Anzac SW-526
Olektron P4-VPS-100-70
Olektron FP-CDB-185
Olektron FP-HJ-302U

I happened to notice that the manufacturers of these items are mentioned briefly in the appendix of the VHF/UHF Manual (Fourth Edition) by Jessop.

Any assistance appreciated.

Arthur Shulman, VE3ZV

7073. Using 3 phase transformer on single phase power?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-13 21:40:50 UTC
From: jflanders2@home.com
Message-ID: <3bf19320.99166124@NEWS>
Source record: 48671

Can I get any practical use from a 3-phase transformer with single-phase power? I hope I can use this power supply at near original design ratings. Please read on:

I am trying to breathe life into an old HF power amp. It used 220 3 phase power originally and I am wondering what use I can get from it's combined screen grid and bias power supply transformer. The transformer primaries are for 220/440, and are currently wired up for 220 use. The primaries are all isolated from each other, can be rewired for 440 (i.e., I have 6 individual 220 windings), or isolated and fed separately as I did in a test below. Primaries are delta, and both secondaries are Y - one marked 800V and one marked 450V. Fortunately, complete wiring diagram and voltages are printed on the transformer. Filters appear to be choke input.

As a test, I isolated one of the delta primary legs and fed it 110VAC while monitoring the DC on the filter caps and looking for smoke. No smoke and I get about 450VDC (unloaded) on one filter cap and about 225VDC on the other. Looks pretty encouraging to me - maybe when I apply full 220VAC I will get roughly normal voltage from this thing.

Anybody have any advice on what I might run into in trying to use this supply on single phase under load? I realize DC filtering would not be up to original performance as-is, and I assume that the single leg primary might even be overloaded if I draw full current from it, but it was originally rated for 24/7 mil-spec CCS, so it might survive OK as is. If not, is it possible to apply power to another of the delta primaries with my single phase power in some way to spread out the load?

Fortunately the blower and filament transformer are single-phase, so this is the only part of the old amp that is in question.

Ideas?

I have a little FM radio I got at the computer store that hooks to the USB port. I did have one that plugged into the PCI bus, but it didn't work well -- I think it got too much interference from the computer. I can capture the output from either one with my regular sound card software.

Do you want good audio, or do you want AM?

Any remotely competent phasing SSB transmitter will
have audio quality comparable to broadcast AM. Use
DSP for the audio processing and you can make the
audio as nice as you like with relatively little
hassle.

What happens at the other end is, of course, another
matter. Narrow receive filters will make any signal
sound bad.

If you think there is really something here, why not
design a rig yourself? If you think AM is anything
more than a nostalgia trip, perhaps you should show
people why.

Hello Laura,

>If you think there is really something here, why not
>design a rig yourself? If you think AM is anything
>more than a nostalgia trip, perhaps you should show
>people why.
Why, because while I've successfully built several kits, one or two
quite involved, I'm no design engineer.

I do not mind admitting that my maths theory lets me down.

I have a good engineer friend and I've seen what he's put into the
calculations for his Class-E 160m PA project. To the point where he was
able to find fault with Fritz Raab's original calc's, the author of the
article.

Fritz kindly acknowledged his mistake.

I am not in this class and I do fancy PWM.

Sorry to hear you think AM is a nostalgia trip.

What do you mean when you say "detector" and "leaded"?

Do you have a part number in mind or a package, or...?

You might look at www.rfparts.com. Their minimum order is $25 but this adds up
pretty quick.

Laura,

I think it is "the other end" that is the problem in Philip's mind.

For 100% correct demodulation of a SSB or DSB carrier suppressed signal
you need a coherant demodulator. Without some phase reference in the
signal or a common reference for the two different end LOs the demod
will always be a little off.

Some people have more trouble "tuning-in" to a SSB signal than others,
I've never had a problem myself, but I know quite a few that just can't
get even remotely close to zero-beat with the (missing) carrier.

If Philip really wants good quality audio he may as well go FM and
suffer the larger bandwidth (just like AM). As a bonus he can use C
class stages at high efficiency and use an off-the-shelf IF strip and
demod chip, greatly simplifying the construction.

Good Electrical handbooks show how to make a Scott-T transformer set-up.
With the Scott T you feed it with 240vac (2 120vac & Netural) and get a 3
phase output
the output voltage will depend on the Transformers

There are people with dry skin and calloused hands. They can fiddle with 120VAC
and not get much more than a tingle. I recall my 8th grade science teacher, who I tried to demonstrate a shocker box I'd built (2N107 transistor, resistor,
capacitor, and the audio output transformer from a defunct Muntz TV, all in a metal
band-aid can).

The box gave the me and the other students quite a zap, but the teacher's calloused hands didnt even get a tingle.

But that's a real gamble, it's just a tingle if the current
flows from one finger to another on the same hand (as when poking your hand into
a wall outlet box). But if it's from hand to hand, the path is right thru your chest,
wherein you probably have a heart that just takes a few milliamps to
get shocked into useless fibbrilations.

IMHO, Not a very good gamble.

And the irony is that when someone specifies a "1N34A diode", they
are more than likely saying "this should be a small signal germanium
diode", rather than specifying a specific part number. Just like
all those 1N914's (more recently, 1N4148's) for silicon small signal
diodes, "365-pf broadcast band variable" for a cheap fairly large
capacitance variable that is readily available, and all those 2N706's
(nowadays, 2N2222's or 2N3904's) for a general purpose small signal
silicon NPN. Yes, there are times when something specific is
required, but as one learns about the components, you tend to
read a generic type when you come across such numbers.

In the case of the 1N34A, the key point is that it be a
germanium diode and not a silicon or schottky diode.

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

7093. Academical project idea:Controlling a Kenwood TS50 with a computer...

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-14 23:22:46 UTC
From: Valentin <radiotito@yahoo.com>
Message-ID: <3BF2FCC6.96DA6F68@yahoo.com>
Source record: 48690
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hello all people. I have an academical project idea. I have a Kenwood TS50 (not TS50S). I woule like to make an application to control my TS50. In my TS50 manual appears little info about the unit IF-10D (with a 6-pin connector). I have no idea how could later I connect the IF-10D to the computer. I think that I should connect to a RS-232 computer port, and perhaps also I need the IF-232...
Also I would like to connect my TS50 to a computer running a server (eg. in Linux OS), and a RealAudio server to broadcast to Internet "real time audio" from the TS50. Then I would like also to develope a Java "applet" to put on a web page on Internet, with the appearance of the TS50 front-end.Then the user should be able to change freq., mode (am/fm/usb/lsb/cw),memories,etc...And of course the operation should be taken on the TS50.
I have a lot of questions:
- What I need to connect the TS50 to a PC? I think IF-10D, but...anything more?
- Once I have connected the TS50 to the PC, I think I could send data from the serial port of the PC to the TS50, but...what data must I send to perform each of the different controls? I think there should be any reference from Kenwood...Any info about this?

The question remains: why AM? Why use a mode that hogs
bandwidth, that is inefficient in its use of power,
and interferes with others? Other than warm fuzzy
nostalgia, what is the attraction?

> Sorry to hear you think AM is a nostalgia trip.

I didn't actually say that in the original posting,
though it is very much what I think. Not to lean on
you. Not at all: I'm genuinely baffled...

Running Time Meter, Measures Hours - Ebay

This running time meter reads in hours and tenths of hours. Timer scale is 10,000 hours, and currently reads 0.2 hours. This meter runs on 115 volts. It was made by Industrial Timer, Model C-25, and it is still in production. If interested, I'll send you the manufacturer's PDF file that describes the meter's specifications. It is in very good condition.

Source record: 48694

It is possible that you could use inexpensive MOSFET switching transistors. It is pretty common to run something like a IRF510 at 5w using 12v. I tested the same unit at 24v and got over 20w out of it. From this experience, you could likely run 60 or 80v or even 180v using an isolation transformer (110v) rectified and filtered and get 100w easily from a higher voltage rated equivalent part.

For example, an IRF730 is rated at 400v, Rds on = 1 ohm, 3 A drain current, Pd = 100w. The MOSFETs with high "on" resistance tend to have a lower gate cap (500 - 600 pf), and Drain Cap (600 - 1000 pf) and as a result tend to switch faster. The 0.02 ohm Rds have too much internal cap to work well at 40m. However, they might be ok if your want a cheap 160m amp instead.

A pair of IRF730s in push-pull seems a good bet to deliver 100w output, while costing you only $2 (Mouser). Heat sink them well! Buy a few extras in case you blow one up during testing.

I would recommend at least biasing the pair separately so that you can balance the idle current in each transistor, perhaps 5% of full load current each.

Remember, MOSFETs do not like more than 12v or so peak on the gate for drive, so do not hit it with too much power. 5 watts drive is almost 22v peak into a 50 ohm load. The required drive would only be 1 to 2w if a 50 ohm load is tied from gate to ground.

Try it! It could be a lot of cheap fun.

A diode that will detect microwave energy. These are typically mixer diodes with a square law character. The package I am looking for is the one with leads, wire leads. Macom make them but they have horrendous terms and conditions. They typically refer you to their agents like Richardson's etc. Problem is that for these specialized items the wait is long. That's why I asked about retail or specialized users who may use theses items.

Hi all,
not to confuse the matter:
The original crystal detector used a galena crystal. Later it was replaced by a cuprox detector, based on copper semi-oxide Cu2O. I have a vintage cuprox detector named "Sirutor" somewhere in my shack. It contains 4 or 5 small pills of oxidized copper. Cuprox rectifiers were widely used also in AC meters before germanium and silicon diodes came into being.
Making a cuprox cell might be quite easy: take a piece of copper sheet (no alloy!), clean it thoroughly and heat it with gas flame to red glowing. The surface turns black - covers with copper oxide CuO. Bend the sheet a bit back and forth: the black oxide falls off and shows the red copper semi-oxide Cu2O. Put a clean steel wire (formed as a spring) into contact with it. Yes, the spring is one pole, the copper sheet the other. The cell should exhibit rectifying properties at very low voltages. Play around it !

May I but in here.

So, you are baffled. Mmmm. No need to be. I don't think you have thought things through. Bandwidth and inefficiency are not issues that bother AMers. Perhaps they choose to indulge, because it's a challenge. And what if nostalgia is an issue, no big deal.

Long live AM!! :c)

Yep, the IF-10D (which is just a box containing a 7404 hex inverter and some pullups) connects to an IF-232C which has a 25 pin serial connector for the PC. There are plans for the IF232C in the ARRL handbook - I just opened one and it looks like standard old 1488/1489 drivers with an opto and a 555, probably to generate -12V. I'd use a MAX-232 these days.

The data format is included in the IF-10D manual.

Now don't start them off:-)

Like yourself I have no argument with the bandwidth but current AM broadcast transmitters have 'overall' efficiency's up around 80% what with class-D/E/F PA's and digital pulse width modulators.

Broadcasters no longer have a cardiac arrest when the utility bill arrives:-)

I know there's stuff on the net, but does PWM, (re AM), do nothing but increase the efficiency of the final amp? Does it increase in any way intelligibility by affecting percentage modulation? What techniques affect modulation efficacy, just some form of compression? Anyone.

With PWM, your potential positive modulation is limited only by your power
supply and tubes.

Whereas trying to pump a non-symetrical signal (negative modulation limited
to 100% with accompanying higher positive modulation) thru a modulation
transformer causes all kinds of nasty stuff to appear in the sidebands.

'Modulation density' is a function of compression and limiting.

I'm not sure there's a uniformly accepted set of definitions. (Some
seem to be driven by marketing hype.) However, a Google search will
turn up lots of ideas; I just typed in "amplifier classes" and got
lots of hits, as you might expect. One of the early ones was
http://www.its.caltech.edu/~mmic/reshpubindex/scott.html, which looked
kind of interesting in a limited area around classes "E" and "F".

Cheers,
Tom

While I am not an avid Am'er, I do, however, indulge in it to some extent. I look at it as just another mode and, while I am aware of its limitations and the reasons some folks don't like it, I still believe it has a place in Amateur Radio--altho not to the extent that SSB does. I just like to come downstairs on a cold, winter morning with a cup of coffee and fire up the rig and chit chat with some of the regulars on 7.290 AM or, at times 29.000 AM. I don't have any special equip-ment--I just discovered that my IC706 does a pretty good job on AM and I have no difficulty enjoying QSOs while pumping out all of 40 watts. I haven't gotten into refurbishing Vikings and Rangers, or Collins AM gear, so my forays into AM are pretty simple.....and infrequent. If I interfere with a SSB station, I will yield, QSY, or go silent. It's no big deal and not a turf issue for me.

I believe the other classes refer to digital modes. Class E is the only one I've read a little about. The power transistor or vacuum tube is operated more like an on/off switch. Since the power dissipated by the device is the voltage across it times the current through it, you switch it on and off in such a manner to minimize simultaneous maximums. In other words if the current is high, you want the device fully on so the voltage across it is a minimum. If the voltage is high across it, then you want the device switched fully off to minimize the current. This works in conjunction with a load network which shapes the waveform to let the switching occur at friendly times so it doesn't burn lots of power while transitioning on/off. The end result is very high efficiency...beyond what you can achieve with class C.

I am going to speculate that the other modes relate to digital as well such as pulse width, etc. I'm just making this up so if someone knows better, please post.

I hope this is informative as I am by no means an expert in the topic.

the dc filtering circuits will require more capacitance and or inductance as
3 phase ripple is effectively 180 or 360 Hz and your b plus will be much
lower...
rotary converters as used by machinists to ge 3 phase for their lathes that
have industrial 3 phase motors is probably a better idea..

For the dielectric resonator, use the Momentum part of ADS to calculate a
set of S parameters from a description of the dielectric and conductor surfaces
and launch point locations. Then plug it into ADS schematic for further analysis
and optimization of the oscillator.

Wait a minute, am I getting confused here. When I wrote the above I'm mixing AM with PWM am I not? I was thinking of a transmitter putting out an AM signal using PWM. With regular AM you Amplitude Modulate an RF carrier with an analogue audio signal and the carrier varies in amplitude according to the audio signal impressed upon it. This produces 2 sidebands either side of a carrier. With PWM the audio must be digitised into pulses (on/off), width of pulses related to audio signal. Well, what is the end result of that, a very efficient final, regular modulation density, but never-the-less an AM signal? I think I'm getting confused about the various issue, like modulation type, amp efficiency, and modulation density. I haven't much of a clue about negative modulation. What's that, when it's at home? Something to do with symmetry of modulating signal I perceive, accentuating the positive peaks to beyond normal, and restricting the negative so we do not acheive a cut off duration. Isn't that distortion? BTW, any answers need to be pretty basic.

PWM works by sampling the audio at an approximately 70 kHz rate, and using those samples to switch the RF amp on in longer and longer intervals(pulse width becomes wider): higher audio sample = longer RF amp on.

benefits (and end result) is very efficient RF stage; no modulation transformer with its losses and insulation concerns, low frequency response theoretically down to DC, ease of adjustment of base RF level (a pot to control the quiescent on-off interval) with attendant RF output level switching (select one of several pots for different levels).

The end result is the same: carrier + 2 sidebands.

now, as far as more-than-100%-positive-modulation vs distortion: If the amplitude of the RF output envelope is a faithful reproduction of the input audio, there is no distortion within the transmitter. There may be deliberate distortion of the audio signal in the processing equipment ahead of the transmitter to produce an audio signal in which one polarity of audio is is greater than the other, but that is the 'fault' of the processing chain.

typically, positive modulation will run up to 125%. beyond that, the distortion gets pretty obvious.

an old trick in the 'traditional' AM transmitters was to run seperate power supplies for RF and modulator stages, this allowed some pretty wild positive modulation figures; for instance if the HV supply was originally 3000 V, then a modulator supply of 4000 V would get you + 133 % pretty easily.

at a 1000/250 watt station I worked for, we rigged the modulators to continue to work at the 1000 watt level at night when the RF stage B+ was cut back to the 250 watt level. this allowed a theoretical positive modulation figure of 400 %, but, as I said beyond about 125 %, distortion gets pretty bad.

we also used a pair of op amps set up as 'ideal diodes' to split the audio into positive-going and negative-going paths, the positive-going side was then run thru an amp that allowed us to vary it with respect to the negative-going half by a figure of 1.0 to 2.0 (100% to 200%), then we re-combined the halves. This let us set the positive modulation independently of the negative.

hope this helps.

7122. FS: DOW-KEY type coaxial relay w/"N" connectors & 6vac coil, LN

7124. LEDs in pulse service

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-16 05:08:10 UTC
From: "Clifton T. Sharp Jr." <clifto@clifto.com>
Message-ID: <3BF49F3A.292A4701@clifto.com>
Source record: 48621

Anyone have any data on how much LEDs can be overdriven in pulse service? Obviously I'm talking sub-second pulses. I'm sure it varies with duty cycle, but I'll bet there are other limits involved. I just can't picture driving a 20mA unit at 20A for one millisecond every second without something bad happening.

Also, what are rise times and fall times like, for both current and light output?

I'm already sure light output doesn't double when current does, just not sure what the curves look like.

I would go with the ATC600S series; 0805s would be a little bit large for the frequencies that you are talking about. You could also use ATC100, A size.

Okay. In a regular AM set-up, you amplify a steady RF input in a class C mode PA, then acheive modulation by varying HT voltage to PA by using a modulation transformer. RF input to PA is clipped, (ie conduction at peaks only) but tank circuit restores sine wave of RF. You get out AM.

With PWM you amplify a PWM signal, in a class D?, E?, F? PA. RF input to PA, is steady, but pulse width varies. RF input to PA is clipped, (ie conduction at peaks only), but tank circuit restores sine wave of RF. You get AM out. I'm not sure if the RF PA is simply amplifying an AM signal. Maybe not, I muse that it's the tank circuit that is vital to producing AM out. IOW, if the PA had no tank circuit (say RC coupling) you would not be seeing AM out, but some distorted signal full of harmonics. Same to some degree with a regular AM set-up.

Nice to hear you do not need to rely on a modulation transformer. Looks like a neat way of producing AM. Pity, there are not some AM TX projects utilizing PWM as Philip commments.

Thoughts: Why cannot you use class E (say) with regular AM? Tank circuit restores sine wave.

Take a look at the application notes at Agilent -- some of the high efficiency LED's can be pulsed at 100ma - although with reduced duty cycle. There are also curves relating luminous intensity to current.

7130. Source for 16 ohm semi-rigid co-ax?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-16 16:35:38 UTC
From: thardy@nautel.com
Message-ID: <228efcd2.0111160835.670a8e3f@posting.google.com>

I need some low impedance line to build a broadband transformer for a VHF solid state amplifier input matching cct. Does anyone know a commercial source for 16 ohm semi-rigid line, ~ 0.1" O.D.?

Thanks.

Thanks much Gary!

I built the McCoy "Full Gallon" CW transmitter shown in a 1962 article in QST (I don't have the article with me). The reason I built it was because it was a two part article and the second article showed how to install voice modulation. It was supposed to be a rig that would provide the novice with a CW transmitter that could be upgraded when the novice got his general ticket. I've been a novice for about 2 years now and I have no plans to upgrade (I really only like CW on 40 and 80 meters) but I am allowed to transmit voice on 10m. I'm thinking that one day I may want to experiment with AM.

I design embedded controllers for a living and PWM is no stranger to me but interfacing a PWM signal to my transmitter may be a bit tricky. Do you know of a web site or book that can give me some practical applications of this method? Any help would be much appreciated.

I can't really answer many of your questions but when I was in college it was about the time that laser diodes got cheep. A friend of mine did his optics project on pulsing a diode. He used an article in Scientific America (early to mid '80s not really sure) that showed how to pulse a laser diode at about 75A for a few micro seconds. It worked well but as I recall the time between pulses had to be fairly large and the diode was in a metal case that was heat sunk (sinked?). Might be worth you time to look into some old SciA mags.

Hi,

Special valves for VHF, UHF and SHF - receiving and transmitting
types. Variable capacitors, coilformers, IF-transformers and other RF
components for sale. Have a look at my web site: www.demostenes.no
and click on 'odds and ends' in the menue.

Regards,

Arnold Goksyr

DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

Thanks Gary for what you have said. I was pretty much thinking aloud and
trying to nail-down, in a bit more detail, how regular AM and AM employing
PWM worked.

I can see that if you are using CW and feed an RF signal into a class C
amplifier, the tank circuit restores the RF sinewave. But that is all you
have, RF. If you feed an AM signal (or SSB) into a class C amplifier the
audio component would distort despite the tank circuit. I'm not really sure
why an AM signal or SSB distorts if fed into a class C amplifier.

I see AM as an RF carrier varying in intensity at audio rate. I cannot see,
if tank circuit restores individual RF cycles in a class C amp, why you get
distortion, but I know you would. I would have thought RF at the plate,
would build up or eb at an audio rate, and that variance, at an audio rate,
would be a faithful replica of the RF input variance. Oh, maybe I just
twigged it. If the RF input goes up or down that would change the duty
cycle. You could end up driving in class B on input peaks, ie at the top
of the audio cycle. Is that why distortion occurs? Again, anybody. If so,

this may explain why you can feed a PWM into a class C or E amplifier, RF input remains a contant value, just width alters.

I'm still not absolutely sure why you cannot use a class E amplifier, modulating with a modulation transformer, to produce AM. Doesn't class E (whatever that is) just use a smaller duty cycle than C, and that tank circuit would simply restore the RF sinewave? You are not feeding the RF amp grid with an audio varying RFsignal. And why use class C for CW if you could get more efficiency from class E? Probably no real advantage when you consider pro's and con's.

I don't know of any 16 Ohm line but 3 52 Ohm lines in parallel makes ~17 Ohm.

WTB: PacComm Packet TNC adapter for Pactor TNC!
I have a PacComm Pactor Controller (SCS PTC-1 design, made by PacComm) which
appears to be pre-wired for an upgrade kit to allow regular Packet Radio to
be used by pushing a front panel switch. The front panel has holes for
additional LEDs and the button is already installed. Inside there appears to
be a long header strip of pins where this ï¿½upgrade kitï¿½ could be plugged in.
Anyone have this unit available?
Please drop me a line if you have any info!
Thanks and 73,
Mike VE3EQP.....>

7137. Want Cubic Astro 102 or 103

All I need is one for parts but will consider a reasonably
priced 102 or 103 that works. I want it to be complete, as
the parts are getting scare and would like to keep this one
for a long time. I have had one on the shelf for some time now
that I would like to get running again. Also, I can't find the
service manual if you have a copy.

not quite

there is a low-pass filter between the modulator tube and the RF stage,
cut-off around 40 kHz, if memory is correct.

it's been 15+ yeasrs since I worked on this beast (MW-5 Harris), so I'm a
bit fuzzy, but there's a LPF in there somewhere

How sharply can you bend it? Coax with Z0 that low will have a big diameter, therefore stiff, center conductor and not much dielectric between the center conductor and shield. PTFE is usually used for a dielectric, and it cold flows, so it might not take too much of bend to short the coax. I'd look carefully at the minimum bend radius spec and make sure it's small enough for your application.

Wow, what a masochist! Just kidding. For what its worth, the bulk of
the problems with SS rigs of that era are simply the little electrolytic
capacitors going bad. You pretty much have to recap them with the same
philosophy involved in replacing wax-paper caps in BAs from the 30s/40s.
Good luck with it. It was one of my dream rigs in those days.

Each of the tubes listed here have been checked on a B&K 667. All of the tubes listed below test STRONG, have no grid emission/gas/leakage, and have no shorts. The tubes marked "USED" may have discolored glass or significantly vaporized getters, but they STILL test strong. I have no way of in-circuit testing, so I can only warrant that these tubes will test good in a similar tube tester and not be DOA, but otherwise must be sold AS-IS.

Richard---

> I'm not really sure why an AM signal or SSB distorts if fed into a
> class C amplifier.

The difference lies at the input point at which the amplifier active device starts to conduct. Remember: An amplifier is biased at class C when it conducts for less than 180 degrees of the input signal (assuming a sinewave input). In order to do this with most common class C amplifiers, the signal is input at a constant P-P level, and the active device biased such that it remains turned off below a certain voltage. The higher the voltage at which the device turns on, the shorter the angular length of the input signal which is amplified and output.

In FM, CW, and other modes where the input waveform is sinusoidal and of constant amplitude, the output angle remains the same and the resulting waveform can be cleaned up by tacking a tank circuit at the output. In AM and SSB, however, the tale is different.

With AM, if you feed the AM signal into a class-C amplifier, you effectively have a signal whose amplitude is not constant over time. Because of this, the amplifier conducts ONLY AT THE PEAKS of the RF envelope, thus leaving nothing for the tank circuit to work on. Instead of interpolating the fall and rise of the signal, the tank circuit gets hit when the AM signal comes to its peaks. In short, the angular length of the output waveform varies instead of remaining constant, and frequently vanishes. This is why it is necessary to modulate the amplifier if linearity at class C is desired for AM, instead of feeding it a modulated signal.

With SSB, we have to look at things a bit differently. The same action as described above occurs, that is that the individual frequency components are amplified at varying and sometimes vanishing anglular lengths. The difference, however, is we are forced to look at a spectrum rather than a carrier. In effect, the same thing that happens with SSB happens with AM, however it is simpler to understand with AM.

Does that help at all?

Thanks,

Henry C. Gernhardt, III

Tim,

Try Precision Tube and Microcoax. They both have some low Z semirigid.
I think 18 is a standard and the length in the transformers is short
enough that the small mismatch will not matter.

Source record: 48645

Just what is the difference between the dielectrics used for run of the mill 0805 X7Rs, say 1nF and a true 'Microwave Grade' SMD decoupling caps.

If it's an issue of just geometry, you could always just go for the next package down.

Any pointers to a Micowave Capacitor FAQ welcome.

Thanks,

Mark.

damn, I wish I had a copy of the manual for the MW-5 here.....

I know there's a filter to eliminate that 70 kc note, just can't remember WHERE it's at in the circuit.....I think its between the modulator tube (which acts as a 'variable ground' between the cathode of the final and ground) and the RF final, but can't recall for sure.

Henry

Thanks for your input. Yes, your explanation ties with what came to me as I was writing my post. As you say, it's the varying amplitude of RF input that leads to gaps or variations in plate conduction at AF that causes the problem, which the tank circuit cannot smooth out. Therefore, we get a distorted output. Well, that looks to me like the answer. So, as long as the RF input is steady in terms of amplitude, I think things are fine. I think you can feed a PWM (PDM) signal into a class E amp and get AM out.

I must get out some of my ham books and look at this subject, they are in the attic and I haven't been bothered to peruse them. :c) I'm sure if I do, other questions I have will resolve.

Rich.

7153. Best tubes to buy from live auction?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-17 06:42:32 UTC
From: googlyelmo@earthlink.net
Message-ID: <3BF606DE.19D690BB@earthlink.net>
Source record: 48550

I am going to an auction this weekend, a local "Americana"/Tchotke store
that is going out of business, and have the
opportunity to bid on numerous lots of tubes (perhaps 50 lots, from
50-200 tubes per lot). I am new to working with tubes, so
my question is this: which tubes should bid on?

I had a look over the lots, and much of it is grouped by tube function
(e.g. regulators, rectifiers, octal triodes, etc.) but not
more specifcally than that (except in a few cases where 7/9 pin minis
are grouped, and to some degree by type designator).
There weren't any really old or rare tubes in evidence at the auction
preview; mostly everything from post-WWII. I am not
going to bid on any high value tubes, especially since I cant test them
ahead of time. I just want to get a start, cheaply and
wisely I hope, at building up a stockpile of tubes to build with (and to
a lesser extent keep my few boatanchors running, though
I know what I need there).

So, please suggest the 10-20 most desireable tubes for all around
building with tubes. If you like, and are willing to put in the
time, you could tell me also which types of various functions/pin
count/era/etc. you think are most useful. Some indication of
value would help me too, but mostly I need to know what to focus on at
the auction. And oh yes, I am going to pick up some
transformers too. Any suggestions on a voltages/current ratings to go
with the tubes? I know this is short notice, but thank you
very much for the advice.

I was also thinking something similar. I think (?) any experienced
homebrewer here would not have trouble making this project:

RF input -> MIXER (NE602) -> IF -> DETECTOR -> AUDIO -> ADC -> RS-232
^^ (NE604/PLL) (MAX232)
Local Oscilator

Another design:

RF input -> TDA7000 -> AUDIO -> PIC1xxxx -> PC-Serial Port
(ADC & RS232)

> The ultimate impossible dream is to sample the
> waves then through some software.

I am thinking about sampling the intermediate frecuency about 455 KHz
with an A/D conversor. And then through an USB port (faster than
RS-232) demodulate it with some software using Pentium MMX
instructions.

Another design will use a dsPIC (hibrid DSP/MCU) to sample and
demodulate simultaneously. Altough the internal dsPIC ADC (10 bits,
500 ksamples/s) is a bit slow in this application.

> Can this be done?Any pointers/reading material is appreciated.

Texas Instruments have some ADC chips (THS1230/40, THS1050/60)
for this purpose (they called it: "IF and baseband digitization")
used in Set-Top-Box (STB) and ADSL.

I think it is possible, but I wouldn't be able to make this works.
I don't know too much about electronics. Searching in the web I
have not found anything yet.

Regards (from Spain)
PD. Sorry for my english

7156. Amateur Radar

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-17 13:42:56 UTC

Hope this is Ok to post here. Cannot seem to find any Amateur Radio/Radar newsgroups to post to! I've played with amateur radio for over 30 years, Am, cw, ssb, packet, fm, etc. I like radar!

I was always fond of working with shipboard radar. In the 70's I worked on Navy ship radar's for 18 years 3 MW (million watt) stuff. 27,000 Volts at 90 AMPS plate current! I recently acquired 2 small
radar units. 1-Raytheon model 1500, and 1-Furuno model 701. They have no cables connecting the antenna unit to the indicator. I am looking for just the Schematic for both units. I have an electronics background and would have no problem making up some cabling. Want to put one of these radars on my tower at home. I use to have one mounted on my truck! (I don't do sea sickness anymore) I have a 250'(foot) tower in my back yard and have line of sight to the horizon,
and someday will mount a web-cam and radar unit and put it up on my web page for all to see. I live up on a hill overlooking Casco Bay in Maine. Would be fun for other amateurs to see live radar of ships at sea! Amateur
Radar. Fun stuff. Can anyone help. Thanks. Bill

What frequency are they on? If you plan to do amateur radar, it would
have to be on a ham band (above 902 MHz) that allows Pulse modulation,
which rules out 1240-1300 MHz and 10.0-10.5 GHz. (97.305(c).

Also, Power Output might be a problem!

From: xpyttl <xpyttl_nospam@earthling.net>
Message-ID: <KNvJ7.29535$RI2.14102399@news2>
Source record: 48555

In it's simplest form, this really isn't very feasible. Think about it a little. The PC serial port can only do 115Kb, this translates to a little over 10K samples per second - assuming you could control the ADC through telepathy or something. To get a pretty good look at the waveform you need to sample about 10X the maximum frequency you want to see, so this would be adequate for frequencies up to about 1K. Not very intelligible audio, although adequate for many digital modes (like PSK-31). With real ADC's that need some housekeeping, you might get one half or one third of that rate.

In addition to that, most people when you say PC think in terms of Windows. The Windows interrupt handling is so inefficient that the interrupt stream from a 100% duty cycle serial input at max speed leaves almost no time to do anything except on the fastest PCs. You can get away with that speed on the Internet because the duty cycle is very low, and internal modems do some buffering so they significantly reduce the interrupt rate. To copy audio, you need to keep up with the data stream. Maybe if you had one of the newer 1.5+ GHz PC's, but even there it would be a push. Certainly not something you could do with the kind of PC's hams tend to have (Pentium's or P2's at 500MHz or less I suspect).

Although the sound card is more complex, and seems harder to deal with, it does do some processing on card and lets you get a lot more data per interrupt. On the sound card, a 44KHz sampling rate means you can get a decent sample of a 44KHz waveform. Not so with the ADC->Serial port approach.

You can actually do better by simply squaring up the audio and bringing it into an on-off sort of port like one pin of the parallel port or one of the serial port control lines. You now would have to write code directly to the iron, not impossible under Windows 9x but a real pain. Tougher under newer Windows OS's. Realistic under DOS or Linux, tho.

Using a parallel ADC into the parallel port might be a little more feasible. You are still left writing direct to the iron. Not impossible, but beyond the programming skills of most hobbyists on the newer operating systems.

The MMX instructions have a lot going for them in this sort of application, but getting the data in the first place at a useful rate is the real challenge. And again, actually using the MMX instructions isn't something you are going to do in an afternoon.

The sound card has a LOT going for it!

The PIC approach is a little more interesting. The PIC can keep up with the data rate (it doesn't have a day job). If you could send the PC some sort

of summarized information, like frequency and maybe some sort of shape characterization, then the data rate to the serial port could be a lot more reasonable. Perhaps you could get away with sending the top 3 or 4 Fourier coefficients or something along that line. Might be interesting doing an FFT on the PIC in real time, tho. I haven't tried that one!

Hello,

We have now LF-chokes for valve amplifiers in stock. They are all 10H
and are available in 50mA max, 100mA, 150mA, 200mA, 300mA and 400mA
Pictures, technical data and price can be found at my web site -
www.demostenes.no

Best regards,

Arnold Goks

DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

Some time ago there was a lively thread here with claims and counterclaims
about the legality, practicality and RF exposure risks of what you're
thinking if doing. You may find it educational to look in deja news or
someplace similar to review them.

I'd use 2 100K 10W resistors in parallel across each cap.
I would also time the discharge of the whole string with everything
assembled, and post a note on the front panel below the plate voltage
meter. Every so often, I'd check the time to see if it had changed.
I've seen too many power resistors open up over time to trust
the damn things. I've just finished working on a boat anchor
signal generator that has an open 20 W 10K resistor, even though
the thing dissipates only 3.8 watts. I like resistors to run at 1/4
of their wattage or less - but even that doesn't guarantee it won't
open, as the signal generator problem demonstrates. I don't know
why these things fail - I just know they do.

Hi,

>Hey , did you never hear of a shorted capacitor?

No, I never heard of an X- or Y-rated capacitor shorting. They're designed not to. Well, strictly, I believe they're designed to self-clear without catching fire, but the result is the same: they don't fail shorted.

Clifton:

Here's yet another "I did this once, but I can't remember the
details...."

In the late 1980's, I was playing around with homebrew A/D converters
and a +150 kbps serial interface. I checked into the specs for LED
on/off times and found that even the cheapies had no trouble being
pulsed at several hundred kbps at typical currents (20 mA or so). They
switched on and off cleanly. I didn't try boosting the current.

That's not the experience I had. I just put in a new LUTRON model
FS-5F today, to see if it'd reduce the RF noise. It did not. S9
noise interference before and after the swap. My receiver is an ICOM
R-70, with the antenna is in the attic and therefore close to house
wiring. Maybe that accounts for the difference between your situation
and mine. Seems to me, that whether the RF is radiating directly from

the device, or reradiating from the house wiring is a moot point. Are there any other models out there that are known to be better? How about the ones with three speeds vice continuous speed control? I just assume replace it entirely with an ON/OFF switch, but the wife likes the dimmers ;-)

particularly interested to learn which techniques were introduced so
early. One such is Q-multiplier, but as regerative IF amplifier, and
it was even a suggestion for RF-amplifier. Have not seen much of the
latter application, only a OZ'stn proposed it for a QRP receiver.

Since ARRL handbook were obligatory for broadcast- and coast stations
- at least in Norway - eralier found 1948 and 49 issues such places, I
suspect that ARRL contributed to ideas for manufacturers of radio
equipment then

The first application of 'Q-multiplier' seems to be in a Telefunken
(Germany) receiver designed around 1936-37, it covered 1.5-20MHz, but
it was a modification in second issue - adding Q-multiplier.

This receiver also had a product detector using triode-hexode ACH1,
but haven't seen such application used elsewhere before 1960

7175. Programming cable for Yaesu FT-8000 / VX-5

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-19 03:58:57 UTC
From: Dave <dalden@home.com>
Message-ID: <296A6DF715F48480.28AAFAA42F3B0D72.A8A004F3D39F082E@lp.airnews.net>
Source record: 48572

I own a Yaesu VX-5 along with the ADMS programming software and cable.
I just bought a Yaesu FT-8000R mobile and can get the ADMS software
for it but what I want to know is if I can adapt the VX-5 cable to
work on the FT-8000R.

The VX-5 cable has the DB9 connector on one end and a regular 3 pin
Mini plug on the other. The 3 pin mini plug is then fitted with an
adaptor that converts the 3 pin plug into a 4 pin plug for the VX-5.

Pinout on the VX-5 3-pin mini plug is:

Ground : Ground
Ring : Programming
Tip : Not used

The FT-8000R Data Jack pins are as follows:

1 - Packet Input
2 - Signal Ground
3 - Ground to Transmit
4 - 9600 baud packet data output
5 -1200 baud packet data output
6 - Squelch

It seems to me that if I make an adaptor to connect the mini plug
programing connector to Pin 1 packet input and run ground to ground,
it should work. Has anyone tried this?

Thanks!

Dave - KB8VJD

From: Hans Summers <Hans.Summers@Tudor.Com>
Message-ID: <9tae19$19hu7$1@ID-61331.news.dfncis.de>
Source record: 48574

I built a frequency counter and a clock using pulsed 7-segment LED's to remove the requirement for series resistors, thereby saving space and power consumption. The digits were pulsed using the blanking inputs of the 4511 driver chips I used. Additionally I used a 1n4001 diode in series with the display.

In the frequency counter the 8 digits were connected in pairs and displayed on a 20% duty cycle and everything went well (http://www.hanssummers.com/electronics/equipment/radiofreqcounter/intro.htm).

In the clock there were 4 digits, driven individually on a 1 in 6 duty cycle. Unfortunately overheating occurred while I was not watching it and the 7-segment displays partially melted, though they are still operational (http://www.hanssummers.com/electronics/clocks/panel/intro.htm).

Absolutely correct! Don't ever depend on a resistor other than one with a value of zero ohm.

Redundancy in the form of parallel resistors _might_ save a cap from overvoltage if one resistor opens. However, even if it doesn't, you can replaces caps but you can't replace your life.

You might also consider choosing appropriately-sized Resistors and
connecting them like this (with another resister in series with the
Neon/Lamp as appropriate for your supply's voltage):

---+----------------+
| |
R R
| |
+----Neon/Lamp---+
| |
R R
| |
---+----------------+

If/When one Resistor opens, the bulb can warn you. Furthermore, one
might even add more Neons or Lamps to say "This resistor string is
still conducting current", and so on. Of course, you still can't
trust the indicators if ENOUGH resistors open!

Source record: 48579

Hi Cliff,

A lot of your answers will be found in Agilent AN-1005, which you
should be able to get in .pdf format here:
http://literature.agilent.com/litweb/pdf/5091-9704E.pdf
If that doesn't work, go to www.agilent.com, and you should be able to
navigate to LEDs under components and find the ap notes section. You
can also get some specific LED data sheets.

Generally the light output follows the current very closely, and if
you're just muxing the LEDs, you're unlikely to be pushing the
envelope. If your pulses are in the 1usec or shorter range, then it's
fair to start asking about reverse recovery times and so forth.

There will normally be a "peak repetitive current" rating that you
shouldn't exceed...it's unlikely to be 20A for a common LED! But
optical efficiency is not a strong function of peak current...10% duty
cycle at 300mA peak is just about the same integrated optical output
as 30mA continuous. See the ap note.

Hope this helps some.

Cheers,
Tom

Yes, there is a set of continuous reports and forecasts running at all
times. Each one gets updated periodically through the day and plugged
into a timed sequencer. The old Bingamtom (NY) office had audio loop
tape cartridges, just like the commercial radio stations use for ads
and announcements. I haven't been in the new facility to see what they
are using.

NOAA broadcasts continuous weather repoerts, usualyl with a synthesized
voice. The weather alerts are only proceeded with an alert tone, that
unmutes equipped receivers and sounds a loud alarm. Once activated,
these receivers need to be reset for the next alert.

Anindita <anindita@uab.edu> wrote:

"when there are no "alerts"? Does it continually broadcast weather information?"

Exactly, and this was the original purpose of the system years before any alerting feature was added. (Incidentally, NOAA Weather Radio was originally intended for marine users, both pleasure boats and commercial vessels; that's why it is in a band near the VHF marine band, so that it could be received on marine radios. The system was expanded to cover other areas after Radio Shack introduced its first Weatheradio in the early 1970s.)

Yes. It's typically a combination of local conditions and forecasts,
and repeats (with occasional updates) every few minutes. Places near
the ocean or large bodies of water will typically have marine
advisories and include things like wave period and amplitude at
various bouys.

Cheers,
Tom

I hate sending this out again so soon, but I've had a banner week scrounging stuff. Anyone need any of the following goodies? PAYPAL is gladly accepted.

Parts for Sale as of 11/19/2001
==========
NEW .1 uF Poly/Film caps - 10% 250v, new stock, paper tape, nice long leads. These are not NPO and are made by S&M Components 50/$3 or 100/$5

NEW 12pf NPO Disc Ceramics, long leads, 50vdc 5% Marked 120J made by NKE, 50/$3
or 100/$5

NEW 470pf Disc Ceramics, 50vdc 5% Marked 471J, long leads, paper tape, 50/$3
or
100/$5

NEW .01uF Monolithic Ceramics, marked 103K, long leads, Made by AVX Corp, 100vdc 10%,
50/$3 or 100/$5

22uF 35v electrolytics - $2.00 and 2 stamps for 100 These caps are on paper tape, NOS (New, but old stock) made by Richey.

I still have some NEW BNC chassis connectors for (inc nut and lock washer)
==========
25 for $14.00
50 for $24.00
100 for $40.00

Voltage Regulators
==========
LM7805C voltage regulators. TO220 case. 5 for $4.00
L7806CV voltage regulators. TO220 case. 5 for $4.00
LM7808CT voltage regulators. TO220 case. 5 for $4.00
LM7812T voltage regulators. TO220 case. 5 for $4.00

3 of each for $10

Transistors
==========
2N2222's NPN in METAL TO18 case - 25/$7.50 NEW PARTS
2N3906's PNP plastic TO92 case - 50/$4 NEW PARTS
2N7000's N-Channel FET plastic TO92 case - 6/2$ 10/$3 NEW PARTS

Surface Mount Transistors
BC847B NPN Gen Purp Amp - Vce=45v Veb=6v Ic=100mA Pd 350mW, Vbe Sat=.77V,

hfe 200-450, FT 200Mhz. 100/$3 500/$10

Crystals
========
3.579545 Mhz Crystals for 80m - These are pulls, $1.00 each (I have 4 left)

POTS
====
10K 1 Turn Panel mount pots. These are pulls. No knobs, just shafts. Most
are Allen Bradley. Pot is about as big as a quarter. With nut. 5 for $4.00
MAKE ME AN OFFER

Diodes
======
1N4148 - You always need these. 100 for $2.00 These are NEW.

Speakers
========
Little 2.5 inch PC speakers, 8 Ohm. $1.50 includes shipping in a padded
envelope. 10 for $8.00 - They work great for little external speakers on QRP
rigs.
Just add a audio amp you make from 2N3906's and you can run your neighbors
out of their house.

Let me know if you're interested. All prices are post paid to the USA,
unless otherwise noted. I will ship to non USA addresses but we need to
discuss the shipping charges first.

Thanks - My address on QRZ is good.

This is getting WAY out of hand. Yes, you can do the
neon thing, but that quickly kills your parts count. He's
got 15 capacitors - your circuit adds 3 parts to each
cap above and beyond 2 resistors in parallel across
each - that's 45 parts unnecessary parts.

Using parallel bleeders is good design practice. You can see
if one has opened by timing the voltage decrease, as I mentioned.
George mentioned using a shorting stick. Absolutely right when
working in the supply. Timing is NOT a means intended to replace
the need for a shorting stick when you are working on the supply.
It is just a means to detect an open bleeder, without opening the
supply up.

may I add a suggestion on safety/shorting stick ?

one way to make the supply safe when working on it is to use a solenoid mounted in such a way that the plunger shorts two contacts when power is turned off; in other words, power-on pulls the plunger UP away from the shorting contacts.

Harris used this scheme on the MW-5 and up units; the first time I fired one up, I damn near wet myself because of the WHAM of two large 220V solenoids slamming up into their coils.

you may want to use a DC solenoid with a capacitor across the coil, sized to give a long enough delay to prevent exessive arcing when it de-energizes.

if you choose not to use such a scheme, PLEASE build and use a shorting stick, religiously. and don't simply touch it to a high voltage terminal, hang it from one while you work on the beast.

you only get one strike with a 5 KV supply.

Source record: 48591

The primary purpose of bleeder resistors across each capacitor in a bank of capacitors all in series is not to protect the careless maintenance man. It is to ensure the total voltage is divided equally between the capacitors. Safe capacitor working voltages are not then exceeded.

Reg, G4FGQ

7197. DC-DC Transfer Switch

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-20 15:46:25 UTC
From: Bob Powers <powersb@willinet.net>
Message-ID: <tvl8cbqiu1luce@corp.supernews.com>
Source record: 48595

I'm looking to build a DC-DC Transfer switch to swithc from my 35 amp Power Supply to battery power when the AC Fails.

My first attempt at designing it was pretty much shot down by friends that knew more than I did. I was going to use a DPDT Relay with an AC coil, but the coil would be energized at all times while AC was on.

I now think I need some kind of logic circuit that senses when the AC fails, THEN maybe energize a 12v Relay using the batteries. As I should be on AC more than Batteries (I hope anyway :))

Anyone have any other ideas or know of anyplace on the Web that has plans or discussion about this type of thing.

Bob

7199. Woden UM3 Modulation Transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-20 16:57:03 UTC
From: Richard Daventry <newsgps_email@ntlworld.com>
Message-ID: <OTvK7.680$V65.102137@news11-gui.server.ntli.net>
Source record: 48594
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,uk.radio.amateur

Hi. I've got the connections and impedances table for this modulation transformer, but does anyone have the full specification, ie frequency response, current or power rating. Thanks.

7200. Elecraft EC1 Design contest

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-20 18:06:52 UTC
From: Eric Swartz WA6HHQ - Elecraft <eric@elecraft.com>
Message-ID: <3BFA9BBC.34AA4377@elecraft.com>
Source record: 48596

Hi,

To help stimulate the creative process, we'll be giving away three of
our new EC1 project enclosures to those who submit the most interesting
suggested designs (concepts only--no schematics required). Here are the
rules for the contest:

1. Design concepts submitted can be for virtually any ham-related
application, but they must be compatible with the EC1 enclosure.
(See http://www.elecraft.com/EC1.htm for pictures and inside dimensions.)
The EC1 is the same size and color as the K1 transceiver.

Designers are under no obligation or expectation to actually build
the proposed projects.

2. Entries will ONLY be accepted in ELECTRONIC form (Microsoft Word,
pdf, html, jpeg, gif, or some combination of these). Each entry must
include at least a one-page description, as well as one or more sketches
showing relevant detail (block diagram, panel layout, physical location
of boards, etc.). But it's the idea that counts, not the implementation,
so there's no need to provide formal documentation.

3. Entrants can submit more than one design, but no more than one EC1
enclosure will be awarded per person.

4. Entries must be sent (via e-mail) to contests@elecraft.com, no later
than Sunday, December 17th, 2001.

5. The three winning designs will be announced before December 31st.
Some or all designs submitted will then be posted on our web site. Judging
will be done by Wayne Burdick (N6KR), Eric Swartz (WA6HHQ), Gary
Surrency (AB7MY), Tom Hammond (N0SS), and Bob Friess (N6CM). (All of us
are hopeless home-brew fanatics.)

6. All designs submitted will be considered public domain. We reserve
the right to design similar products in the future.

We look forward to seeing what you come up with!

73,
Wayne, N6KR
Eric, WA6HHQ

It may not need be that complicated, depending on the power supply you are using. I have several switching supplies on remotely located base stations that simply have the battery paralleled across the supply output. The supply voltages are set to the battery manufacturer's float charge voltage. When the AC fails, the load is placed on the batteries. The trick here lies in IF you can backfeed voltage to your particular supply without damaging it.

Why did they shoot down that idea ? I have done the same thing but I
did use a time delay relay to pull in a heavy relay. The time delay was
set so that the AC power had to come back on for atleast 30 seconds
before the power would come off the battery and back on the AC supply.
That prevents a lot of chattering and surges if there is just some quick
off and on surges on the AC line.

Hi Richard,
I remember many years ago using that mod tranny.
The spec used to be printed in the old RSGB HANDBOOKs if memory serves
me right.
I not sure if I got handbook around but I will look.
But this may jog other folks memories.

This can be overcome with a series diode which can handle the current...Keep
in mind that you will see a small voltage drop from the power supply due to
.6V or so being dropped by the diode..

A nice touch. This delay is employed in commercial type transfer switches
as well....

Mike

Why not two diodes with the cathodes connected together and going to the load and the two anodes going to the battery and ac supply? Diodes heavy enough to carry the current are cheap and easy to find.

Johnny

I do have that table on page 502 of the 3rd Edn of the RSGB Hbbk. I'm looking for the info. on the other specs like audio response characteristics, and currents or voltages. I suppose that might not be easy to find. One might need to see a copy of a Woden brochure.

Rich

The advantage of using a supply that can withstand backfeeding is that you can use it to float the charge the batteries.

Also, unless special diodes are used, the .75 volt drop from a lead acid battery amounts to a major portion of its discharge cycle; the equipment may not like the apparent low DC voltage.

Six Capacitors, Oil Filled, 35 mfd 2000 volts - Ebay

I purchased these at the Dayton Hamvention a few years ago for $60. There are six, all of them 35 mfd, at 2000 volts, oil filled. (I was going to build a big amp, and use them series/parallel to give me 52 mfd at 4000 volts). The dimensions of a single capacitor case are: 6"x 4"x 3". There is a set of mounting clamps for each capacitor.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1299911640

Other items:

Running Time Meter, Measures Hours

This running time meter reads in hours and tenths of hours. Timer scale is 10,000 hours, and currently reads 0.2 hours. This meter runs on 115 volts. It was made by Industrial Timer, Model C-25, and it is still in production. If interested, I'll send you the manufacturer's PDF file that describes the meter's specifications. It is in very good condition.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1664045217

Rotary Inductor

This inductor has 20 turns, and a coil diameter of 3 inches. The overall length, including brackets and shaft is 9 inches. Overall width is about 4 inches, and height is 4 3/8 inches. It is very well made with smooth action, and a well designed contact mechanism.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1297783250

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

use MobilOne 5W30 synthetic engine oil

or mix it 50/50 with ATF to hold down the cost (M-1 is about 4 bucks a qt)

M-1 has heat-transfer abilities better than almost any oil available to the public

we use a 50-50 mix in heavy-duty truck transmissions

Simply choose Schottky diodes for this "wired-OR" supply technique to
keep the forward drop down. Also this does NOT preclude using the PSU
to charge the battery, That simply needs another feed across the
anodes via the method of your choice. Can use another diode.

Probably makes more sense to use ONE diode in line with the supply to float charge the battery at the recommended voltage, and run the equipment from the battery terminals. Why bother with diode ORs and subsequent "patches" to keep the batteries charging? KISS.

Radar is real fun to play with, and the ship board PPI stuff is
way more fun than the 90degree scan aircraft stuff. I doubt if you
can really legally do what you want to do, but I doubt if anyone
really cares, as long as you don't cause interferance to local weather
radars also running in X band. You can have a blast triggering every
'bird dog' for 30 miles in every direction. (hehehe) I kinda got away
with doing what you want to do, because I have a 'ships radar
endorsement' on my commercial ticket, and of course it was neccesary
for me to 'test' units live for 'proper operation'. There is a real
good furuno guy up in alaska, and he is both a ham, and reads this news
group. If no one comes to your aid, I can look up his email, or snail
mail addy for you. I am dead sure I have the snail mail addy. Please
post back your success or failures to the group. My return addy is bogus
to prevent spam, but I can send you a good 'reply to' if you are
interested.

Save your time, effort, and money, and just fill it with mineral oil
and forget it. I once filled one with 'inerteen'. Oh, do I have to
mention that inerteen is 50% pcb, and as F'ing flammable as kerosene!

As a matter of fact, many transformer oils will flash to flame at
low temps. Odd isn't it?

So whats wrong with being energized all the time? If it is a low
current, or low wattage coil it will eat very little. Now a relay
to handle your current demand, with only a low wattage coil is an
entirely differant issue.

An "X- or Y-rated" capacitor was not mentioned, by me,
or Hagstar (to whom I addressed my post, or Glen to whom
Hagstar was responding, or Robert (the original poster) to whom
Glen was replying.

I take it you are willing to bet your life on an "X- rated or Y-rated"
capacitor, whatever that is.

What really surprises me about this thread is that no one mentioned
replacing the line cord with a 3 prong, grounding style cord and
plug, and connecting the ground to the metal part of the lamp.
(Hopefully it was mentioned, and I just missed it.) It solves the
problem safely.

Russ, the transformer oil is also used for lots of other industrial uses. Machine shops use it, stone cutters use it , electrical re-winding shops use it.. Texico sells it under the name "Almag"they normally sell it in 5 gallon cans or more, they may give you the name of some local users...Also MFJ will sell you a gallon.. good luck Harold W4PQW

Couldn't agree more, but we use the two-diode approach with some PSU's
whose output is not readily adjustable to ideal float voltage. That
way, only the charge current (which is a lot less than full output)
needs to be "controlled" to get float voltage.

I also use a 20A @ 13.8V on the bench, which has provision to float a
backup battery and a changeover relay for mains fail event. In my
application, I didn't want the heat/magnetostriction_noise from the
20A supply going 24x7, so i disconnected the charge circuitry and put
a 13.8V 1.0A supply on the "backup" line. So 24x7 the 1A supply feeds
a couple of Rx, and when the need to Tx arises I bang the main switch
to ON and 20A is available.

Thanks for the E mail. Glad to see someone that's not just interested in the DC ham bands. Been there done that! So far I did hear from a guy in Alaska. He was going to find a manual for me. But he doesn't have a scanner. So I'll have to wait and see. This is a Furuno 701 radar. I worked on the display all night. No schematic. But it would come on and then shut off. Found a spot on the PC board where the 200V line caused a burn trace on the board. Well I used a dental drill and ground out the carbon trace then gave it 2 coats with some Corona Dope I had. Waiting for it to dry. Need cable hook-up between Indicator and Scanner. Scanner has 2 terminal strips, that's it. Well wish me luck, and tahnks again. Bill

Radar is real fun to play with, and the ship board PPI stuff is way more fun than the 90degree scan aircraft stuff. I doubt if you can really legally do what you want to do, but I doubt if anyone really cares, as long as you don't cause interferance to local weather radars also running in X band. You can have a blast triggering every 'bird dog' for 30 miles in every direction. (hehehe) I kinda got away with doing what you want to do, because I have a 'ships radar endorsement' on my commercial ticket, and of course it was neccesary for me to 'test' units live for 'proper operation'. There is a real good furuno guy up in alaska, and he is both a ham, and reads this news group. If no one comes to your aid, I can look up his email, or snail mail addy for you. I am dead sure I have the snail mail addy. Please post back your success or failures to the group. My return addy is bogus to prevent spam, but I can send you a good 'reply to' if you are interested.

KX3XXX but you know the x's are place fillers to protect the guilty! best 73's and best luck! Gummi.

rcnixon@mindspring.com (Russell C. Nixon)
shared these priceless pearls of wisdom:

->Ok, I was just given a genuine Heath "Cantenna" and now I need
->transformer oil. Any ideas out there as to where I can buy or
->scrounge a gallon.

Straight automatic transmission fluid will give you about 90% conduction; mixing the ATF with a *really* good synthetic winter motor oil (5W30 or so) will give you closer to 95%, while transformer oil is down in the high 80% range.

(Yes, given a Cantenna and enough time I could reduce the equations to ï¿½C/Watt rise of the elements, but Russ gets the idea.)

I've had notions from time to time about playing with
synthetic aperture radar. Why should NASA have all the fun?

You need some compute power to make it work, but that's
a minor consideration nowadays. There's lots of published
information.

7235. FS: Old Radio Books 1937-1980, $9 each

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-22 05:48:29 UTC
From: oldbooks78@aol.com
Message-ID: <20011122004829.22976.00001300@mb-mr.aol.com>
Source record: 48529

I currently have the following old radio-related books for sale. Available for $9 each postage ($2 for the first book and $1 for each additional item):

Terman, Frederick Emmons "Radio Engineering" published by McGraw-Hill, 1937 Second edition. The 813 page hardbound book is in about very good condition. Pages are clean with no page tears or pen marks except for a previous owners name inside the front cover, and a "Property of U.S. Navy" stamp lined out. A comprehensive engineering treatment of radio technology from the 1930's.

Massey, H.S.W. and R.L.F. Boyd "The Upper Atmosphere" published by Hutchinson of London, 1958 The 333 page hardbound book is in good+ condition. It is an ex-library copy from a corporate library, with a card pouch inside the rear cover, and the usual stamps and stickers. The rear inside hinge is split, but the cover is securely attached. Otherwise in decent condition.

U.S. Naval Training Schools "Basic Radio Notes & Communication Circuits" published in Chicago. The 147 page softbound book is in good+ condition, clean with no page tears or pen marks other than a previous owners name inside the front cover, and again on the page ends. The covers are a little chipped along the spine, but everything holdong together nicely. Not dated, but looks to be c1950.

Rider, John F. And Seymour D. Uslan "FM Transmission and Reception" published by John F. Rider Publisher, 1948 Cloth. No Jacket. First Printing. The 409 page hardbound book is in very good condition, clean with no page tears or pen marks except for a previous owners name inside the front cover. Covers the basic principles underlying the operation of FM transmitters and receivers.

Hornung, J.L. "Radio Operating Questions and Answers, 10th Edition" published by McGraw-Hill, 1950. No Jacket. The 588 page hardbound book is in very good condition, clean with no page tears or pen marks, and a strong binding. Blue cloth covers show quite a bit of wear, but the cloth is not torn, and everything is tight and secure.

Miller, Wayne "Radio Operators' License Manual 1944" published by Ziff-Davis Publishing, 1944 Cloth. No Jacket. The 229 page hardbound book is in very good condition, clean with no page tears or pen marks except for a previous owners name inside the front cover, and a note inside the rear cover. A nice early study guide for obtaining a radio operators license.

Bennington, T.W. "Short-Wave Radio and the Ionosphere" published in London: Iliffe & Sons, 1950 Cloth. The 138 page hardbound book is in very good condition, in a good dust jacket. A look at the role of the ionosphere in short-wave radio communications.

Saveskie, Peter N. "Radio Propagation Handbook" published by Tab Books, 1980 The 499 page hardbound book is in very good+ condition, clean with no page

tears or pen marks except for a previous owners name inside the front cover, and a name stamp on the bottom page ends.

Hoag, J. Barton "Basic Radio, The Essentials of Electron Tubes and Their Circuits" published by Van Nostrand, 1942 The 379 page hardbound book is in very good condition, clean with no page tears or pen marks except for a previous owners name inside the front cover.

Albert, Arthur Lemuel "Radio Fundamentals" published by McGraw-Hill, 1948. The 595 page hardbound book is in very good condition, clean with no page tears or pen marks, and a strong binding. Green cloth covers with gold lettering on the spine. The text covers all of the basic acoustical and electrical principles of radio. A very nice copy.

Ghirardi, Alfred A. "Radio Physics Course; An Elementary Text Which Explains the Principles of Electricity and Radio" published by Radio Technical Publishing Co., 1942, 2nd Edition The 972 page hardbound book is in about very good condition, clean with no page tears or pen marks, and a strong binding. Some minor spotting on the top page ends, otherwise very nice. Burgundy cloth covers with gold lettering on the spine. An excellent old radio reference.

Ballou, Willis H. "Radio Fundamentals" published by the U.S. Naval Institute, 1942 Second edition. The 260 page hardbound book is in about very good condition. Several passages are underlined in pencil, and there is a previous owners name stamp inside the front cover. Otherwise nice. A WWII era text for Naval Academy cadets to learn the fundamentals of radio.

If interested in any of the above, please email to "Oldbooks78@aol.com" to reserve. Thanks, and best regards.

Dave

Hi Russ:

When I purchased my Cantenna from Heathkit in the 1970s I was told, and have since used, pure mineral oil.
It's available in a 1 gal bottle/jug from any local drug store; expect a curious inquiry as to what you're going to do with it.

Triplett 100-0-100 Microampere Meter Model 420 - Ebay

This is a very nice meter, with perfect movement. 100-0-100 microamperes, DC. The bezel dimensions are 4.625 x 4.125 inches. A 2.75 inch hole is required for mounting. Flaws: 1) One of the four mounting screws is missing, leaving three. 2) On the left side of the front bezel at the back, there is a 3/4 long by 3/32 wide area that is partially broken away. If a perfect appearance is important, this flaw could be easily patched after mounting, although I don't think many people would notice it if they didn't know it was there.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1666488890

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

I have also thought about the idea (below). Also, since pulse is not
permitted at 10 GHz you could use a CW signal and FM modulate it.
Then do an FFT on the return to get range.

Unfortunately I am not that good a programmer.

Looks like a nice enclosure. Sure wish they were bigger, though! 2.1"
x 5" x 5.5" isn't much real estate, especially for $50.

> When the AC fails, the load is placed on the batteries. The trick here
> lies in IF you can backfeed voltage to your particular supply without
> damaging it.
========
Indeed ,keeping the battery all the time on 13.8 V float does not need any
switching over.
Any potential backfeed problems can be overcome by inserting a hefty diode
in the PSU output (before the battery) and adjusting the PSU output to 13.8
+ 0.7 = 14.5 V to overcome the voltage drop across the diode.
However it is essential always to place a fuse in one of the battery leads
(usually in the + lead) immediately after the battery.

To prevent the battery from 'sulfating' following long periods of
non-activity e.g. no power cuts ,it is important to make the battery doing
work ,by switching off the PSU for some time while operating the rig. This
should be done say 4 times per annum (once every 3 month)
The battery is considered discharged when its terminal voltage is 11-11.5 V
. It is important to monitor the battery voltage with a directly connected
voltmeter or a low voltage threshold alarm circuit (flashing LED or bleeper)
Alarm circuit can be a simple Opamp (comparator) arrangement using a zener
diode as a voltage reference .

Another advantage of using a permanently connected battery is the
non-requirement of a high power PSU. Depending on the battery capacity ,
duration of an operating session and mode of operation e.g. SSB or CW versus
AM or FM , instead of a fully rated PSU of say 25 Amperes ,you only need
a 10 Amperes PSU or even less . This because of the duty cycle of the power
supply system is often very low.
Assuming a typical transceiver with 100 W RF output requiring a peak
current of 20 Amperes during tx and say 2 Amperes during rx , and with
equal tx and rx periods the duty cycle is never larger than 60 % (under AM
,FM operating conditions).
When operating CW or SSB it is much lower ,perhaps as low as 15 -20 %.
This means the battery is providing the peak current ,with the PSU rated
for the average current.
In this situation the battery is 'healthily active ' on a regular basis (
with an active operator)

Also from a cost point of view always using a battery in combination with a low(er) power PSU might be attractive.

Safety considerations : Inside the shack ,only use sealed batteries . A non-sealed battery must be located in a well ventilated area ,
Any remote location involves heavy cable to minimise voltage drop . Welding cable with a copper cross section of at least 16 sqmm (0.025 sq inch) is particularly suitable .

I operate my station including peripherals and shack lighting solely on 12 V batteries which are charged by a wind generator (and in future also by two 64Wp solar panels) The 'wet' batteries sit on a well ventilated loft ,whereas a number of 18 Ah sealed batteries are used inside the shack.

Hi Guys;
I have for sale this nice SBE-33 transceiver. Brought it up on a variac, was'nt used in years. The cabinet was discolored so I compounded it, looks much better.
There are 2 mods, one is a Headphone jack in front, nicely done.
The other is a tiny neon light in the back, its on when the rig is plugged in, why? who knows?
There are 4 rubber bumpers on the side so you can stand it on end during transport.
I get about 60 to 40 watts out depending on band, all seems to work, used Drake mike plug & wiring, ssb works also, receives well.
Uses Collins Mechanical Filter. I have the Alignment instructions & schematic.
While it works & looks nice, I cannot guaranteee the alignment but you can certainly make contact as it is!
Oh, all plug in transistors for receiver, 3 tubes in the Rf.
Check these pics, nicely made inside!

Source record: 48545
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,sci.electronics.design

I am gathering info to build an HF amplifier but have not been able to find a good design for a truly braodband tank circuit. I know that the amp will always be used with a tuner so it makes sense to make the amps output fixed at 50 ohms or close to that over the full range of each band. I suppose a resistor would do but then there would be the power considerations.

Tnx

The 1015G uses a MGF1402 or ne25337 from the print that came with it. I don't see why they would use another device in your preamp. The do have a web page somewhere with the schematics on it. You might have to search for Mirage or maybe it is the MFJ page as I think they were merged or bought out.

You need to know the complex output impedance of the amplifier across each band and then devise a circuit that best matches it to 50 Ohms. Alternatively you can just get it closer to 50 Ohms, and rely on the tuner to do the rest. Keep the coax run between the amplifier and tuner as short as possible if you want to maximize the bandwidth.

Designing and building transistor radios by R.H.Warring.

I had a copy in the 60's containing mainly OC44 germanium
transistor circuits but lost it during a house move.
for some strang reason I want to read it again!

It's still listed by Barnes & Noble but I presume it will
have been updated to silicon devices.

Anyone know? or have a copy from the 60's to sell.

Cheers

No such thing as a "broad band tank circuit" A tank circuit implies energy
storage
such as used with a class C amplifier. As such it is narrow band. Other types
of amplifier operation can be coupled with a matching circuit and maybe a low
pass
filter.

What type of amplifier are you planning?

Yes it does continuosly broadcast weather information. In my local area
a test of the alerting system is broadcast on Wednesday afternoons which
causes receivers equipted with alert functions to turn on. Along the
gulf coast we are susceptible to VHF skip conditions that on occasion
allow us to hear stations as far away as Houston to the west and Tampa
to the east. til we meet again. . . . . Tony D. KC4YBE

You didn't mention if it's a solid state amp or a vacuum tube one.
For solid state, have a look at the work Helge Granberg (sp??) did
while at Motorola (Lots of ap notes!)...or see any number of other
references. For a vacuum-tube amp, if you use a tuned tank, you're
stuck with some minimum Q; but if you put a broadband transformer in
the circuit, you could get to rather a lower Q. Mind you, you may not
really WANT all that low a Q! Depends on what you're trying to
accomplish. But you could put in a 9:1 or even 16:1 broadband
transformer and have to match a much lower impedance ratio. I'd for
sure put the transformer at the output of the tuned tank. Do you have
any reference books to help you out? BTW, the old Central Electronics
rigs used cathode-follower outputs, as I recall, for broadband output.

Cheers,
Tom

Use a high wattage 50 ohm resistor, add a ventilated metal box to heat shield it so you don't burn your hands, and so-239 connectors on the ends.

It is just a big non-inductive resistor of 50 Ohms.

You can make one out of any bunch of carbon composition resistors that
add up to 50 Ohms. For the lower HF bands, carbon film work fine too. 2
100 Ohm resistors in parallel, each being 2 watts power handing gives
you a 4 watt dummy load.

Just add more resistors of higher value to get more power handling.
The liquid cooled dummy loads work just the same, only the works is
bathed in an oil that helps get rid of the heat faster.

Dummy loads are more mechanics than electronics anyway ;-)

For HF:
What about a 1/4 gallon glass recipient with metal cover? Install SO239
in cover and solder copper electrodes to it. Fill recipient with
saltwater. Connect to rig and measure SWR. Add salty solution to lower
resistance or destilled water to rise resistance. Try on different bands
to watch frequency response. Stop when solution starts to cook.
Don't make the mistake to check resistance with ohm-meter (DC)!
This was a recipe that I was told 25 years ago by an active om.
OK - you can use a 1/2 gallon paint can as well but it will corrode
within short but offers shielding until then.

Unfortunately never tried this myself but I'm about to try now as soon
as I get my license (waiting for signature on desk of president of
local gov agency "CONATEL" - ready next week if I'm fortunate).

I would appreciate comments on this cheapy-method.

Another question: Why are the two dummy loads, which appeared in the
"Station Accessories" section (34-22 to 34-29) of the 1988 ARRL
Handbook, not reprinted anymore in the 2001 edition? Wouldn't matter
to have 1208 instead of 1200 pages...
Surplus Sales of Nebraska still offers low-L-high-wattage resistors.
As far as I could see surplus dummy loads are still more expensive
than homebrew.

Regards, Ike

Six 300-ohm 1-watt metal-film resistors in parallel make a 50-ohm 6-watt load.

Or ten 500-ohm 1-watt metal-film resistors in parallel make a 50-ohm 10-watt load.

Four 50-ohm 10-watt loads in series-parallel make a 50-ohm 40-watt load.

Nine 50-ohm 10-watt loads in series-parallel make a 50-ohm 90-watt load.

Dunked in oil the wattage ratings might be trebled for a short time. Or use a cooling fan. Suck it and see.

Don't use wire-wound resistors.

=======
Since you wish to use the dummy load on VHF ,it is not easy to make one from loose resistors ,since the SWR might be unacceptably high due to wiring inductance. There is a dummy load described in various editions of the ARRL Handbook ,built around a large carbon resistor of 50 Ohms ,but even then the SWR might be rather high at 144-148 MHz
The simplist way to get a good compact VHF dummy load is to use 1 or more MP-820 Kool-Tab power film resistors . They are made by Caddock - Riverside ,California ,but are generally available (perhaps not @ Ratshack).
The rating is 20 Watts (maybe a different model nr has a higher rating)
Uncertainty (accuracy) = 1% .
Hence 2pcs of 100Ohms in parallel can handle 40 Watts continously when put onto a large heatsink ,as close as possible to a BNC ,N-type or what ever suitable female socket connector you prefer.
The resistors come in a TO-220 package with a 0.142 inch hole for single screw/bolt connection to the heatsink. The 2 leads should be cut short for lowest possible SWR ,with the socket connector also attached to the heatsink through a drilled hole.
Following fixing/soldering ,the resistors can be covered by a metal cover.
For good heat conduction between resistors and heatsink use the usual paste.

After you build the best dummy load you can, go out and buy 100 feet of RG58. Use that between the load and your transmitter. The cable loss improves the characteristics of the load.

I have several sets of pulls (long unused) from local tv station
and several sets of pulls (some unused equipment) from FAA and Air
Force equipment
4cx 250/4cx150

I also have the following radios for sale

Clegg FM 76 rock bound 220
1296 homebrew kit xverter 2 meter in between 2-5 watts out with 5 in
2304 mhz xverter homebrew kit
2304 mhz TWT amp 10 watts out (heavy, shipping costs will be $25)
1296 amplifier 1-5 watts in 400 max out, in a 7 foot rack (LOCAL DFW
only due to weight) needs to be rewired, also runs on 220
2 meter tube amp (4cx2/150) needs rewired has tube supply
no shipping on this amp due to weight dfw area only
2 meter all mode 25 in 170 out transistor 12 volt amp
6 meter 4cx 350(2 tube) amp in a case with power supply
(shipping would be $40) amp has not been turned on in 3 years
power supply was reworked, then lost 6 meter radio

I can be reached via email or phone ONLY not via newsgroups

I am not sure why aluminum wouldn't work. The current HP, Boonton, and Rohde & Swartz RF generators use aluminum for their RF assemblies. Rockwell-Collins HF80 and HF9000 equipment uses aluminum.Also, their R388/51J series, and their 51S-1 receivers were fabricated from aluminum. Motorola uses aluminum as the base metal for their power amp assemblies. Aluminum and brass are very good shielding materials for electrostatic shielding, while mu-metal is good for magnetic shielding. Sometimes a bi-metalic structure consisting of both of these materials is used. Copper is a good material for shielding coils; I believe it has a negligable effect on tuning and Q, but feel free to correct me if I am wrong on this one.

Aluminum is fine for RF shielding. Where did you hear is isn't?

With a solid state amp, you're more likely to have trouble with RF currents in the "ground" conductors than fields being radiated through the air.

A broadband tank circuit is the antithis of what you find in an amplifier.
Tank circuits are high Q = narrow band, but you can add presets to cover the
bands in steps. Moving in frequency requires retunning to put the impedance
back where it belongs.

Aluminium makes an excellent screened enclosure. Look at most
high-spec signal generators and spectrum analysers. Even in
very critical applications like duplexers for VHF/UHF repeaters,
aluminium works very well.

Some of the Motorola application notes recommend that you use
a copper plate between the transistors and the heatsink to
lower thermal resistance.

Be careful! don't let the smoke out of those lovely fets.

He's trying to convey the message that individual resistors soldered
firmly together in parallel might have less inductivity but far more
capacity against ground and thus not be suitable as a dummy load for
VHF and that the difficulty is mostly of mechanical nature.

;-)

The only homebrew dummy load for VHF *and* high power I've found so
far is in the 1988 ARRL handbook. The article is also the only one
that I found, which shows a plot of the SWR over frequency. Again:
you need to be mechanically skilled to build it - but not too much.
It is usable up to 1400MHz. Has the worst SWR of 1:1.5 @ 800MHz and
below 300MHz is about 1:1.1 SWR. Around 400MHz @ 1:1.25 SWR.
The only expensive part is the carborundum resistor.
Surplus Sales of Nebraska still seems to have such Rs.

I offer fotocopies to the original poster.

Regards, Ike

I made one using 6x 300 ohm 2W resistors mounted radially on back of
N-type male chassis connector, shortest possible wire length. Measured
it and was still useful on 1296MHz with 13dB return loss, but
substantially better on the lower frequency bands.

It is easier to solder the resistors when a thin metal plate is fixed
to the connector with 4 screws.

Similar principle may be used for higher power, but maximum frequency
may be lower. Mine has been used up to 25W and the resistors are quite
burned after some years of service, but still measure 50ohm load
resistance

Made some different, but those with male connectors are most practical
as they may be connected directly to Bird model 43 without any cable

application of high wattage reistors decrease maximum frequency
because of the mechanical size, inductance depends on length and also
stray capacictance may be a problem.
I connected 6x 300 ohm 50W noninductive resistors from a discarded TV
transmitter, but it wasn't much useful above 30MHz, particularly
because of high stray capacitance, and physical size of the
construction.

Hi,

I have found a few nice Telefunken valves:

1 pcs ECC 81 NOS, original box <> $ 30.-
1 pcs ECC 82 NOS, original box <> $ 30.-
1 pcs ECC 82 NOS, white box $ 20.-
1 pcs ECC 83 NOS, original box $ 25.-
1 pcs EL 84 NOS, original box $ 30.-
3 pcs EF 86 NOS, original box <> $ 35.- each
1 pcs EF 86 NOS, white box <> $ 30.-
1 pcs EF 806S NOS original box <> $ 35.-
2 pcs E88CC a little used <> $ 25.- each

<> means diamond mark between the pins.
E-mail me if you are interested.

If you visit my web shop at www.demostenes.no you will find a lot of
valves, sockets, transformers, components, books etc. etc.

Best regards,

Arnold Goksyr

DEMOSTENES - N6899 Balestrand, Norway

I went to my local electric company service center (where they rebuild their transformers) and they gave me a gallon. They buy it by the tanker load every now and then and the cost of a gallon is so small they don't fool with charging for it. It's a very refined type of mineral oil with a few other additives to fight corrosion and water absorbtion... and it's pcb free. It is available to the public from petrolium distributers but the minimum purchase is 5 gallons <grin> or a 55 gal drum depending on the distributer. It's also used in Bird coaxial loads.

Indeed, for UHF/SHF stuff at relatively low powers I've used chip resistors soldered radially between the center and the flaring of an N connector. A few chip resistors across the end of a short piece of hardline soldered into a SMA connector works well too. Such a contraption is flat to 5 GHz or better if carefully made and not cooked too often. It can't handle much power though, but power loads up there can just be a bucket of water.

The original poster was concerned with mid VHF, so even better carbon film resistors will work fine. I've noticed that the lower value carbon films are a solid film and have no spiral groove, but as you try higher values for extra power handling the inductance goes up (the groove thing), but as you are paralleling more of them it is quite acceptable for the lower bands.

I'd recommend building it radially on the back of a SO-239 and testing it, the return loss should be quite acceptable. Just file the back of the connector down to its brass core and using a heavy iron tin the whole back side. (Needless to say you need one made with teflon insulation). Then solder all the resistors to the flange. Once you've done that, let it cool so you can handle it. Bring all the resistors together towards the center pin and carefully solder them all together.

Another method that I don't recommend (but it does work quite well) is to carefully chip or file off the encapsulating gunk on the end caps of the resistors. Once you've exposed most of it you can tin the cap easily and the rest of the stray rubbish will slogh off as slag. If you are careful you'll end up with an undamaged resistor with no legs, just

a ceramic tube with the film and the two end caps ready to be soldered directly across the connector just like with chip resistors. It takes a while to do, but makes the result more useful at UHF.

Of course the important part in making any dummy load is to burn yourself several times. Burnt offerings of human flesh appease the radio Gods and ensure high return losses.

Not as funny as it seems. I knew a guy once who bought top-of-the line everything - his radios, his car, his house, his blender, (his YF :-)) etc. He was convinced that his method of cramming coax shield into a connector, unsoldered, was the best way since the "heat affected the dielectric constant". Haven't heard him on the air in years, though.

the problem is you have more than 4 resistors mounted radially from
center pin of connector it is physicly impossible to get near the
center pin, then you still need some wire length - at least in one
end, but for 3-4 power resistors it might work

Source record: 48415

In Bill Orr's Radio Handbook, there is a chart to estimate the output levels of many power transformers, in the Power Supply chapter near the back of the book.

A good way to figure the secondary voltage, is to use a "Variac" on the input, apply 1.2vac or 2.4vac, and add "00" to the readings on your DVM, on the secondary. This should give you a good idea of what the "actual" full voltage should be.

Wire Ga. size can also help you determine the current rating, by using the continuos current rating of the given wire Ga. size, de-rated by 1 wire Ga. size from the actual size, to take into account the windings poor heat dissapation capacity.

I hope this helps you.

Some of the old ARRL handbooks had a chart in them that tells how much
cross section of the core is needed for a certain power level. It takes
so much 'iron' to handle the magnetic field.

> I have several old unmarked tube era transformers. I can easily find out
> the voltages, unloaded, of the various windings.But, what is the technique
> to estimate the available current per winding, or the total power safely
> available from the transformer

==========
A generally accepted rule of thumb is to measure the no load voltage then load the winding
increasingly and measure the current when the voltage has dropped by 5%.
That current can be safely considered the rated current.

If the voltage is in the multikilo-volt range it might be tricky to measure the current in the winding. Voltage can be safely measured via a resistive 'tap'
Current can then be measured in the primary winding, however the no-load primary winding current should then be taken into consideration.
At 5% voltage drop from no load to rated load of the winding being measured ,the increase in primary winding current can be used
assuming that transformer loss is constant (probably not entirely true) ,P (primary) = P (secondary) from which the secondary winding current can be calculated. This method is perhaps not very scientific ,but good enough to determine the rated current and hence rated power of the winding .

Of course loading a HV (multi-kilovolt winding) is a topic in its own right. Perhaps it is possible to decrease the primary voltage with a variac (variable auto-transformer) to such a level that loading the secondary winding becomes manageable, but then determination of the rated current at HV level becomes much more complex . Any comments ? Perhaps from RF Power Amp constructors ?

>Aluminum is fine for RF shielding. Where did you hear is isn't?

About 30 years ago when I was a young engineer an old and respected engineer
told me it wasn't. I didn't ask why until now. I have noticed over the years
that consumer electronics that required shielded sections did not use Aluminum.
That may be because it does not solder to the circuit boards too well.
Initial testing of the amp without an enclosure or shielding produced a large
increase in rfi to all electronic in the house. Even with no power to the amp
I got rfi just going thru the t/r relay on the amp. I did not get a chance to
test whether the increased power caused the rfi to increase. At this point I
decided that shielding and careful control of common mode currents throughout
the entire rig, tuner, amp, feedline, antenna was in order.
BTW thanks for EZNEC Roy.

>Be careful! don't let the smoke out of those lovely fets.

Ed., You may not believe this but I installed the fets backwards! I was convinced there was only one way they could be installed. Wrong. Anyway I applied the 50 volts to fets installed wrong and got no output. After much head scratching and when I found out what I had done, butt kicking, I unsoldered the fets, put them right, and the amp worked. They must be pretty tough because I applied wrong voltages, and a lot of heat unsoldering. Amazing they lived thru that.
Nice web site, visit often.

It is mechanically challenging yes, but not impossible, 1 watt resistors fit quite nicely leg-less between the flange and the center conductor, staggering them up and down on the center pin helps pack them in, you end up with a large blob of solder in the middle linking the center pin and all the resistors, the result is probably more capacitive than inductive.

You are correct though, 8 resistors is probably a practical limit with 1 watters. The 1/4 watts are much easier to handle, but are obviously limited in power handling.

There is some info in the ARRL antenna book for 160 metres, just add more turns to get onto the MW band. Basically you get yourself a ferrite rod, wind enough turns to resonate at about 500 kHz with your average BC tuning cap at its fully meshed point. Pick off the signal with a few turns, you can add an active pickup using a FET if you like.

Using litz wire is recommended, but not required.

I've recently built a tuned loop for the MW band. It is air cored though, and really works very well with good nulls to put noise or local stations you are trying to ignore into. I wrote up the details on my website last night in fact.

I saw a PIC based one floating around that spits out the frequency in
morse at the click of a button. IIRC it was built into an altoids tin
and did up to about 50 MHz.

One of the approaches to making a dummy load from low-power
film or composition resistors is to construct it as a
series of cascaded attenuators. This allows the heat
dissipation to be spread out over a large number of resistors
without running into impedance mismatching problems trying
to get all of the resistors close to each other. To make
the approach work at VHF/UHF, the attenuator sections can
be built over a ground plane, microstrip-style. The power
dissipated in each attenuator section is equalized by
designing the first sections to have a small amount of
attenuation (say 0.1 dB) and then gradually increasing it
in the downstream sections. The downside of this is that
one has to manage a plethora of different-valued resistors
rather than a number of identical ones. Of course the last
'section' would be a 50-ohm termination that can safely
dissipate the 'attenuated' signal.

Hi,

The main reason not to use aluminum is that it is hard to make a good connection to. With an amp you want to be able to do multiple low impedance connections to ground. They handle a *lot* of current so the need for a good connection is worse in an amp than it is in a lot of gear. In the days of resonant output (pi match) networks the circulating currents often ran 10X the current out to the antenna.

The second reason is that aluminum joints to other metals if not properly cared for can oxidize fairly heavily. The resulting connection will be an RFI producer. This is not as big a deal if everything is made from aluminum. It is a big deal if you have a steel chassis with aluminum shielding on top of it.

Enjoy!

Unfortunately it doesn't spread the dissipation as well as you'd like,
because most of the dissipation will always be in the earlier stages.
For example, if you put 100W into three cascaded 3dB attenuators,
followed by a dummy load, the dissipations will be:

Stage 1 50W
Stage 2 25W
Stage 3 12.5W
Load 12.5W

The same applies to dummy loads made from very long lengths of lossy
coax - they always melt at the input end.

You can get a idea of current handling by measuring the temperature rise after running a know current through the winding. You do that by measuring the temperature
and resistance of the winding. Then put a know current through the winding and after a suitable
delay again measure the resistance. The change of resistance will give you the temperature
rise. Of course you have to look up the constant related to temperature and resistance.

The transformer should not exceed 140 deg.. F. at a high maximum.

Cheers.

To be honest, I saw this successfully done in one of my
employers' labs quite a few years ago, noted it down as
a readily available alternative to a huge non-inductive
resistor and forgot about it until this question came up.

So I didn't crank out the design for myself and come up
with a scheme that would give each attenuator section
precisely 5 watts (or whatever) of dissipation. I'll
do that later if I have time and post the results.

Loading till the voltage drops by some amount is a reasonable start,
but how do you figure the current of each winding out of several?
Things can get rather complex. I like to measure the resistance of
each winding. The resistance and the voltage tells me something about
the wire gauge used for the winding, assuming I can't just measure the
gauge. Transformers have typically been designed with wire sized at
500 to 1000 circular mils per amp. Many wire tables list the circular
mils for each gauge. The core cross-sectional area will give you a
pretty good idea of the overall power rating...or more properly the
overall volt-ampere rating...of a transformer. (Realize, too, that
the power you can get from a transformer feeding a rectifier depends
on the filter following that rectifier...a large capacitor at the
filter input causes current spikes in the transformer that have
relatively large RMS to average ratio, and it's the RMS current that
is what you care about in the transformer, but it's the average
current that you get out of the DC side.)

Keep in mind that ultimately, it's internal temperature rise that
limits the power handling of a transformer. If you're up for some
somewhat tedious measurements, you can get a pretty good indication of
the actual operating temperature of each winding as follows. Measure
the room-temperature resistance of the winding accurately, then
operate the transformer (under some conservative test loading) for a
long time, till it reaches thermal equillibrium. Then disconnect the
power and quickly (before it cools) measure the winding resistances.
Use the (about 0.39%/degree C) temperature coefficient of resistance
of copper to figure the temperature rise. You may have to re-run the
'speriment with different loadings, till you're happy you've found a
rating you're comfortable with. What's safe? Depends on the
insulation in the transformer! I'd say a max 80C internal temperature
is fairly conservative, but the cooler the transformer (and the more
thermally-tolerant the insulations--which is really hard to know
unless you're given the specs, in which case you wouldn't be having to
measure it!), the longer it will live.

Cheers,
Tom

Have an old Rohde & Schwartz type RBD 60 ohm 20W 600MHz Dummy Load
/Attenuator, but since I didn't like 60hm, I had to open and modify it

It was a surprise to learn that they used relatively large resistors,
looks like 5W consumer types, and still it is claimed useful up to
600MHz! Have not measured it, it is heavy and little used, since
attenuation is not exact any more, and my own construction weights
only few percent of this boatanchor.

You are describing a construction which is very much similar to the
construction I've already described in another thread some days ago. I
am not sure how important it is to remove the wires completely when it
only reduce the resistor length by 5-10%, it may help in some critical
cases, but my construction was useful beyond 1200MHz

By the way, wonder what is a so-called non-inductive resistor? It may
be an expression for HF amateurs who have never experimented on UHF,
any wire length has some inductance. Have a feeling that many of the
views expressed here is what may be found in books, but who has any
practical experience? Who has got their construction measured
extensively?

Generally assumed to be carbon comp. The newer carbon-film types are typically cut as a spiral resulting in a few small turns that I 'guess' would be something you don't want at VHF/UHF. -Bill

==========
In an earlier posting re this topic I referred to the use of Caddock MP 820
non-inductive power film resistors.
Attached to a photo copy of the spec sheet I have a test sheet (possibly
from DUBUS magazine ,since it is in German)
Test of a MP 820 , 50 Ohms , 1% done with a Rhode & Schwartz SCALAR
Network Analyser and a R & S SWEEP GENERATOR , 0.4 to 2500 MHz reveals the
following :
Freq Range Return Loss SWR

0.4 -100 MHz 52 dB 1.00
500 MHz 34dB 1.04
1000 MHz 16 dB 1.37

It helps for UHF, but for HF I wouldn't be bothered.

> By the way, wonder what is a so-called non-inductive resistor? It may

No comment.

I don't have a network analizer or any such funky equipment, just some homebrew directional couplers, noise bridges, etc. That is pretty limited equipment for seeing how flat a dummy load is, all I can say is it looks pretty resistive in terms of its return loss at the frequencies I use it for.

I am not rich enough to have a TWA so I only have milliwatts above 23cm where chip resistors are fine and my measurements are rubbery anyway.

I wonder if using carbon film resistors as a center conductor in a
piece of homebrew coaxial line could wash off the power slowly, like
lossy CRO probe coax designed to absorb reflections.

It would still get stinking hot at the front though, but you could
taper the values like the attenuator discussed above. I doubt the
construction effort would be worth the result though.

Do a search on "National Radio Club", an association
of MW (AM broadcase band) DXer's.

Although if you have the room, a 2-4 foot square tuned loop
works great and eliminates the need for ferrite rods.

I believe it. I've murdered a few transistors in my time.

Wrong way around would put +4V (approx.) on the drains and
+50V on the gates! I don't have the data-sheet for the MRF150
but I would expect them to survive 50V on the gate. I'm glad
you got away with it. It's ok to blow up 99c switching mosfets,
MRFxxx's are a bit too expensive to let the smoke out.

> Nice web site, visit often.
> 73 Gary N4AST

Thanks for your kind comments. I'm playing with a new PA using
a single MRF140. It gives about 40W out with a 13.8V supply,
150W+ with a 28V supply. I'll put the details on my web-page
soon.

7359. Kinda odd question on parts recycling

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-27 20:30:37 UTC
From: Cathexis@yourhaterols.com
Message-ID: <3c03f533.98995829@news.erols.com>
Source record: 48356

Greetings,

I have two broken major appliances headed for the street;
A GE front-load washer and a GE toploading dryer. The tranny's
out in the dryer, don't recall what's broken with the washer. but
the repairman made it clear it'd cost more for old parts and labor
than it would to buy new units. Both maybe 10 years old.

My question is: Anything of * radio * homebrew potential
worth salvaging here? Not even sure what there could be, but
how often do I throw out major appliances? So thought I'd ask.
Interested in some simpler projects for the winter such as crystal
sets, a regenie radio perhaps, maybe some test equip. like a GDO,
although I already have 2. perhaps some tx. kit or some such.
Labor and time are not an issue, but I'm no expert . Hope you can
help.

Hi,

I have 3 pcs of the very scarce EF 14 valves. They are Telefunken and
one of them have even a 'Wehrmacht' label and the datecoding 05 45
They are all unused and two have original boxes. The price is only NOK
929.- or about US$ 103.-
You can look at a picture of them at my web site - www.demostenes.no
Just search for EF 14 in the field down in the left corner of the
opening picture.
E-mail me if interested

Regards,

Arnold Goksyr

DEMOSTENES - N6899 Balestrand, Norway

Hello--
While large appliances don't offer as many possibilities as electronic appliances,
you can generally scrounge some hookup wire, possibly a timer mechanism or electronic
timer, a microswitch or two, and Nichrome elements from the dryer (for dummy loads, plastics-bending
strip heaters, etc.).

Hardware (nuts, bolts, brackets, leveling feet) may be too rusted to bother saving.

Small timer motors may include removable magnet wire that will work for winding coils.

Oh, and don't forget the power cords<g>.

seems to be difficult to use such components above 1000MHz, but a
dummy-load with N-connector marked 10GHz was found useful only up to
5.76GHz

I do not doubt whether you have practical experience, but have a
feeling that many of the other refers to book, another exception from
this is of course G3SEK

I am surprised to read about what is necessary or what is not, when my
practical experience and proven results from using measuring equipment
which a professional company are pleased to help us at rallies -
indicates something different.

A friend who is a wellknown German microwave amateur made extensive
experiments on 10GHz, he was so fed up of hearing important notes,
particularly how important to use silver, he tried to investigate the
sources from the bullshit, and everybody claimed they had read it, and
one author had read it in another book, and this have been going on
for many years, so he discovered that much of the so-called golden
rules are just bullshit.

Bt the way, I bought a direction coupler with SMA-connector from a
Dutch amateur for $20.- at a rallie, and he had many, so it is not
impossible to find cheap in Europe

I don't believe this for a minute. To my knowledge there isn't a
scalar network alive that has the ability to accurately measure 52 dB
return loss without heroic effort. You would need at least 60 dB
directivity and port match to do this accurately. A carefully
calibrated VECTOR analyzer with full error correction can do this, but
even then it is not routine.

Instrument makers work very hard to build short sections of precision
beadless air line standards that have 60 dB return loss and these must
be literally handled with gloves on to keep contamination from
degrading the performance.

A really good labortory grade sexless 7mm termination will typically
be rated no better than 40 dB RL.

A 52 dB return loss is a VSWR of 1.005. Assume a perfectly
non-reactive resistor that gives a 1.005 VSWR. It can be either
50/1.005 (~49.75 ohm) or 50*1.005 (~50.25 ohm). This 1% resistor has
to be within 1/2 % resistive and totally non-reactive (a good magic
trick for a resistor in a non-coaxial TO220 package) over temperature.
With a perfect 50 ohm, just 0.25 ohm reactance will give a 1.005 VSWR.

Sorry Frank, I'm not picking on you for posting this. I know you are
only the messenger, but sometimes these claims just have to be
challenged before they become "laws."

7371. FS: WWII Radio Fundamentals Book, $9

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-28 15:52:04 UTC
From: oldbooks78@aol.com
Message-ID: <20011128105204.04371.00003420@mb-fc.aol.com>
Source record: 48368

I currently have for sale a copy of "Radio Fundamentals" by Willis Ballou, published by the U.S. Naval Institute in 1942 Second edition. The 260 page hardbound book is in about very good condition. Several passages are underlined in pencil, and there is a previous owners name stamp inside the front cover. Otherwise nice. A WWII era text for Naval Academy cadets to learn the fundamentals of radio. Available for $9 plus $2 postage (book rate within the US, or $4 for Priority Mail). If interested, please email to "Oldbooks78@aol.com" to reserve. Thanks.

Dave

=====
Wes , Tnx for your response , your comments are important , since many on
this NG , like myself ,are amateurs (read : non -RF professionals)
Indeed, I was just echoing info given to me with a sample of the said
resistor ,during a 'UK QRP gathering' a few years ago.

You might also wish to retain one or more 'fixed setpoint' temperature switches and the adjustable water level switch (often with more than one setpoint adjustment) the latter item for potential use as an air pressure switch in a Valve RF Power Amp to protect the valve(s) against loss of air cooling due to blower failure.

7375. Audio video switch

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-28 19:02:43 UTC
From: John B <robotwizard@nospamnospamworldnet.att.net>
Message-ID: <nxaN7.239693$W8.8317076@bgtnsc04-news.ops.worldnet.att.net>
Source record: 48372

Hi
I need to build an Audio/video switch that is capable of selecting between 4 inputs and 4 outputs. Does anyone have or know of a good design ?

thanx,
John KB9WTK

7376. Program DIPOLE2

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-11-29 02:09:39 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <9u45e4$77j$1@uranium.btinternet.com>
Source record: 48373

NOW AVAILABLE ** Program "DIPOLE2.exe

An update of programs Dipole1 and Varney.

DIPOLE2 analyses the performance of any HF dipole of any height and length, at any frequency, plus a balanced feedline of any impedance, length and attenuation, plus a balun of any impedance ratio, plus a coaxial line of any impedance, length and attenuation, plus a "tuner" with an L-matching network. (An L-match always has a lower loss than a T or Pi).

Computed results include R+jX input impedances of antenna, of balanced and of coaxial line. Antenna radiating efficiency. SWR and loss in balanced line, coax and tuner. Tuner L and C values to match system to 50 ohms are computed. And overall radiating efficiency.

If either coaxial or balanced line is not needed set the unwanted line length to zero.

The program tells the user immediately the consequences of changing something at one point in the system which affects something somewhere else. For example, if it is asked should a 450-ohm transmission line be increased or decreased in length to provide a more accurate 50-ohm transmitter load impedance, the program will tell you not only which way to go but the actual change in length which should be made. See Cecil's W6RC website for practical implementation. It will also advise whether a change in feedline Zo might be a better option.

Facilities are provided to search for resonant frequencies of an antenna plus feedline. It will be noticed they are not harmonically related. The effects on resonant frequencies of varying in small increments the lengths of dipole and feedlines can be investigated.

DIPOLE2 is about 70 kilobtyes. One file only. Download from website below in a few seconds. Not zipped up. Run immediately.

I am ready to dump several thousand (new, never even used) old chips.

Mostly digital, some op-amps.

All in sleeves.

They are available free... BUT
I DON'T want to spend much time on this.
(The distance to the dumpster is short!)
You come pick them up or provide some wicked easy way to ship.

They are in Shirley, Massachusetts about 35 miles North West of Boston.

E-Mail if your interested.

To the best of my knowledge, there are no current manufacturers for this part. Non-adjustable ferrite loop antennas may be salvaged from old transistor radios. Your best bet for an adjustable one is an Amateur Radio swap meet, or Ebay.

Doug Moore

7389. I've got a big one, have you seen one bigger?

Source record: 48388

The wire hooks both to the center (one leg of the dipole) and to the outer shield/case of the SO-239 (the other side of the dipole). You do not need a store bought balun, just wind 10 or so turns of the coax into a 6" loop near the connector and tape it together. This will stop any RF from radiating off the shield of the coax.

A dipole isn't going to work all that well on CB as most CB is vertically polarized and a dipole is horizontal and bidirectional. Try sloping the dipole or make a vertical colinear antenna. It will give you a couple of dB gain and be polarized properly for the band.

No, we referred to them as "AC rated"- as I recall this was clearly spelled out my Robert C. in the (quoted) post. I follow your logic in all this, I'm not sure I understand how I you're suggesting we should modify all of the numerous radios that came with such bypass caps *from the factory*. Do you simply leave them out ?

John H.

Size matters I suppose. I mean, I guess if you were to bundle lots of
ferrite rods together the signal would increase. I was looking at Amindon's
rods, 100 dollars for a rod appx, 3/4" by 7 1/2 ". That's a lot of money.
This rod I have probably cost 5 bob in 1960.

I'll refer you to some I am selling via ebay for all the specs and stuff
but I'm selling straight out as well.

It's got 8 poles of filter.
If you look at the IC datasheet, it looks easy enough to
defeat the liimiter and use as a straight IF with
4 poles at 45MHz and 4 at 455.

Bandlimited output could be used with PeeCee sound card
for DSP IF.
Add some mixers in front and you've got a RX.

$10/each plus 80cents postage for one or two
$1.03 postage for 5

Hello--
Nichrome is probably a trademarked name for a nickel-chromium alloy
that's used for fabricating heating elements. It will withstand very
high temperatures and is frequently
used for all kinds of electrical heating elements. There should be a t
least one and possibly two heating
elements located somewhere within the clothes dryer's air path.

Try a google search on the word "nichrome" and I'll bet you get lots of
hits, most of which will
be irrelevant<g>.

> how do i convert a computer headset/ mike to work with my icom 725?

You will likely need a preamp. I assume the headphone mike is an
electret condensor element. What you will want to do is duplicate the
circuit of one of their desk mikes. You don't need any extra power as
it's supplied by the hot mike line. "about 8 volts or so". You will
need to make a copy of a icom or whatever preamp. It's real simple.
There may be a circuit description of a icom desk mike in your manual.
You could use that or any other suitable preamp. I think heil makes
one for their desk mikes to run on icoms. I had to do this on the 730,
and I still have to run a preamp on my desk mike for the 706. It only
does about 1/2 power with the element direct. So I use the same 730
preamp on the 706. I use an audio technica dynamic mike as a desk
mike. MK

Nichrome is a registered trademark for a nickel, chromium and iron alloy mostly used to make electric heating elemens. http://tess.uspto.gov

You can find it in virtually all electrical heating applicances. You can see it at work by peering into your toaster. You can buy it in any appliance repair parts place and most good hardware stores.

Go to www.howstufworks.com and enter "nichrome" in the search box.

Can somebody steer me to an explanation of e.g. the following code on a molded mica cap: CM35E 103 JO3. I know the 103 part is the capacitance; mostly I want to know the voltage rating. I have this vague idea it's the 'E' part... Anyway, I had a printout of this stuff once but can't find it, so any help greatly appreciated. Thanks.

73,
Mike, KK6GM

As long as it is cut to the right frequency,run it straight back to the radio...the only thing is that it will be horizontal polarity using the dipole.

According to my old Allied Electronics Data Handbook you have
CM35 - lead mounting, molded case, mica dielectric
E - Temp. coefficient parts/million/Celsius = -20 to +100 with
capacitance drift of +/- (0.1% +0.1 pf)
103 - value = 10000pf
J - capacitance tolerance = +/- 5%
O - Operating temperature range = -55C to +150C
3 - Vibration grade = 10 to 2,000 cps

There is a note in the chart indicating that the voltage rating was
not indicated on earlier production caps. If it had been present it
would have appeared as another cap letter after the E.

I'm reasonably confident in this info, but I have seen other charts
that have differed in some cases. This is the best that I can do.

FWIW, I would toss the cap in favor of something less likely to cause
problems. Mica caps of that era DO go bad.

Hi All;
I am looking for the add-on TNC kit for the PacComm Pactor Controller.
This unit was made in the early 90's and added packet capability to the HF
Pactor Controller which already worked for Amtor and RTTY!
Does anyone have one of these units sitting around?
My Controller already has the faceplate and switch for this mod.
PacComm, apparently, no longer support ANY of their Pactor products!
TIA

Try this web site:
http://zeus.cedcc.psu.edu/caps/mica_eia.html
It suggests that particular one is 300V: the J is 5% and the 03
should be voltage rating. (Google searches are wonderful...found that
one in just a few seconds. I used to have a cheat-sheet on them
too... ;-))

Cheers,
Tom

Thanks for the info, Ken. I've heard that these caps can get flakey,
but these are clean NOS and I'd like to use some for their period
look. Does anybody have any experience regarding how troublesome
they're likely to be?

Yes. I built an amp with a pair of 8950's in GG. When the
8950's died from years of abuse, I replaced them with PL519's.

It's a few years ago and I have forgotten most of the details.
The 509/519 has a different heater voltage and IIRC a different
base.

7425. Stroboscope for CW RX tuning

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-02 21:20:12 UTC
From: la8ak.xnd@online.no
Message-ID: <3c0a99d0.268793295@news.online.no>
Source record: 48322

Just worked a cw contest. Several stations seems to have a problem
tuning to correct frequency, so I wondered if it is a stroboscope type
tuning indicator available to aid this. I was thinking of the type
used to indicate mains frequency, but operated around 700Hz.
The principle of mechanical stroboscope used for 50Hz will give good
indication for varying amplitudes, but a more modern version is more
interesting than converting the old system

any suggestions?

Hi, J-M,
What do you mean by "tuning to the right frequency"? Most CW ops,
especially the transceiver crippled, tune for the note that pleases them
- or provides results. The fact that you heard them bears out this
theory.

Source record: 48324

FYI after the ban on PCB oils that was the mainstay of xfmr oils, many electronic oil baths were converted to peanut oil. Now days I would go with the drugstore mineral oil.Doesn't get ransid.

Get realistic thermal transfer efficiency of the oil is not you limiting factor in a cantenna, its the limited surface area of the paint can and the can to air junction resistance. The resistor-to-oil and oil-to-can thermal resistances are still lower no matter what oil you use.

Put 12 ohm resistors in series with a 100 ohm. Whats your current? Chamge the oil from 80% to 95% transfer and you get maybe 10ohms + 10 ohms + 100 ohms. What's your current now? Not significantly different.

Most of the increase in test time comes from the thermal storage capacity of the oil, not its heat transfer characteristics.

Save your money and pour in the baby oil. Tell em you run a daycare.:)

7428. Re: LEDs in pulse service

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-02 22:48:35 UTC
From: mwp <email@nothing.tome>
Message-ID: <pan.2001.12.02.16.48.33.691675.1222@nothing.tome>
Source record: 48325

Not sure what your trying to accomplish with pulse driving LEDs,
If your trying to just mux LEDs, the duty cycle has to be adjusted such
that the current averages out to the typical 20ma forward current limit.
At the same time you can not exceed the peak forward current and
duration and repition rate as given in the data sheets,

If however, you are trying to use IR LEDS for fiber optic or remote
cotrol application where the instaneous intensity is more important
than the average intensity, you might want to select LEDs designed for
those applications. The pulse characteristics are better defined,

As with all diodes the major limiting factor will be the juction
capacitance. The capacitance limits the rate at which you can turn the
LED off. As a result your current flow may be longer than expected and
you made one fast firecracker.One solution to this is to reverse bias
the LED to literally suck the charge out of the junction. The problem
is LEDs tend to have poor reverse breakdown voltages (typically make
pretty decent inaccurate 6 volt zeners).

The generic LED is basicly a very poor substitute for a fast switching
diode. Electrically, that's what you need, but LEDs are designed for
light output characteristics.

Hello,

We have now in stock an extensive range of high voltage transformers
for valve amplifiers and other valve equipment. 230V primary and
secondaries for both anode and heater circuits.
Also filter chokes of 10H 50mA, 100mA etc. up to 10H 400mA.

Pictures, technical data and price can be found at my web site -
www.demostenes.no
(click on the English flag on the left side of the opening picture to
get English text).

Best regards,

Arnold Goks&#65533;yr
DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

7430. Re: Using 3 phase transformer on single phase power?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-02 23:09:21 UTC

Source record: 48327

I hate to be the pervayer of doom, but it might be cheaper in the long run to build a whole new supply. As you already know you will have to rework the LC filters for the 60Hz ripple vs 180Hz. As someone else indicated you can use one section of the transformer as a single phase transformer. Your KVA rating will be 1/3 of the 3 phase rating. The voltages will be less. The Scott T circuit will not give you what you want either with the same stansformer.

Ja, you could buy a rotary converter to generate 3 phase from single phase. We used to use one for 400Hz power for aircraft instrumentation. They are expensive even on surplus. They are noise and waste a lot of power.

Your best solution would be to find a surplus single phase supply and use the three phase as a boat anchor.

Personally, I use Schema a dos app from a company called Omation.
Omation has been sucked up by somebody and they were sucked up too,

I paid probably $3500 for that and the then version of PADS-PCB. None of the drawing programs quite as productive as comercial schematic capture packages. If I were to by the software today it would cost like $10K.

A few years ago when I got tired of Windblows 98 being worse than 95, I converted to Linux. I do mostly web programming for a living and Linux is the OS of choice for web servers.Our Linux servers were not rebooted for 9 months until they were relocated to a new facility.

What I am getting at, if someone is considering kde apps like Koffice, consider putting up Linux on a partition. Lilo (linux loader) allows you to selectively load Linux or Windows on the same machine. I have this setup on one of my machines, although Linux runs 99.99% of the time You can also boot Linux out of a Windows folder although this isn't as nice as a seperate partition.

I haven't used Schema in a while, but when I do it will probably be with dosemu over Linux.The 14 year old 486 dos box is getting pretty tired.

Everything I use on a daily basis is open source and only cost me the download and install time. There are a number of excellent amateur radio applications available for Linux too.

This was not intended to start any flames here, I'm just trying to suggest alternatives.

Frank Dinger wrote:

> Indeed ,keeping the battery all the time on 13.8 V float does not need any
> switching over.

IIRC 13.8 i.e. 2.3 volts per cell is more a 'charging' voltage than a 'float' voltage?
Recommended 'float' voltage for lead acid cells, once they are fully charged, is I believe 2.15 to 2.17 volts per cell. This floating voltage is almost exactly 13 volts for a six cell 'string'.

The float voltage is designed to prevent deterioration of the cells due to 'local chemical action' while they are being neither charged or discharged! Long periods at full charge voltage could, as I understand it, cause the batteries to overcharge, possibly sulphate and to 'gas' excessively. I have seen batteries, in an extreme case, 'boiled dry' by over charging in excess of need!

When lead acid battery cells go on discharge the voltage per cell falls quickly to 2.0 volts per cell and stays almost at that figure until shortly before the cells are exhausted and on their last few per cent of discharge. That is why monitoring only battery voltage is a dicey business; 12 volts across a discharging battery could mean anywhere from fully charged to ten percent left in the batteries!

It is true that battery voltage is monitored by certain types of equipment (particularly solid state equipment) where the relative voltages are important. When it DOES fall below a certain threshold that equipment is designed to cut out/shutoff in order to protect itself.

Whereas more old fashioned equipment, for example the older style electromechanical telephone switching gear, may just keep staggering along until it just can't move. I vividly recall some dial office telephone switches that were supposed to work in the range 52 to 46 volts. During a prolonged power failure many switches continued to work, sort of, down to around 42 volts! We were amazed!

By the same token a remote solid state switching office isolated for days by severe snow storms worked fine ' until .... 'kaput' gone! As it was designed to do.

So; as I understand it, don't over volt batteries continuously; you aren't doing them any favours. Terry.

a
> 'float' voltage?

The 12 volt lead-acid and sealed lead-acid batteries I've dealt with are indeed specified to "float" at 13.8 volts. You can safely leave them across a 13.8 volt source indefinitely. 13.8 volts can also be used to charge the battery if it is low so you also need to provide some type of current limiter to protect the charger and/or battery if there is a chance that the battery could be in a low charge state when first connected to the supply. If the battery is low, it will attempt to draw considerable current from the supply (thus the need for a current limiter). If the battery is fully charged, it will quickly rise to 13.8 volts and draw very little current from the supply - taking only what is needed to keep it "topped off".

> Can anyone out there help?

Is it the transformer HV winding or a heater winding that has lost it's
centre tap?
If a centre tapped heater winding (let's say it's for a 5 volt rectifier
for example) and the voltage to chassis is not too high you could
parallel another heater transformer, secondary only, across the faulty
winding and use it's centre tap instead of the original one? The
paralleled transformer secondary winding would only serve to split the
'series' current equally. The heater load itself would continue to be
provided by the original winding. An idea?
The additional transformer may/will be at high voltage though? so it
must withstand that voltage to chassis; or however you mount it? However
if the heater winding is for a transmitting power amp. it's voltage to
chassis will be much lower possibly at cathode voltage. OK?
I hope otherwise your main transformer is OK?

7438. Re: BLEEDER RESISTOR

Source record: 48334

Most failures to power devices are the result of inrush current or thermal cycling.

Resistors also have voltage and peak current ratings that are not as obvious power rating. Catalogs rarely publish these ratings. Instead you must consult a data sheet.

When power off your supply, you're dumping the energy of the magnetic field of the transformer.Instantaneously, the voltage across the bleeders is doubled.

Power line transients can ride through a transformer. More often the transients are spikes which can raise the secondary voltage by 25% or more.

In high voltage supplies you could be exceeding the voltage rating on a transiet and/or power off. The resistor may be flashing over internally which effectively raises the current. As a result the resistor may fail from excessive instantaneous current. Repeated power cycling can cause the insulation value of a resistor to be damaged and eventually self destruct on a flash over.

As someone suggested if you parallel resistors you get redundancy. You may also consider a series combination to increase the voltage rating.

In the circuit of this thread, the nominal bleeder voltage is 350 or 400VDC if that is doubled on power off this will exceed the typical 500VDC or 750VDC rating of most power reistors. Since parts are secified on a worst case basis, you probably can get away with it for a while. Eventually, the resistor gets tired of the abuse and dies.

7439. Re: Stroboscope for CW RX tuning

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-03 01:19:02 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <3C0AD306.AB41FB2A@eznec.com>
Source record: 48336

The problem is more likely due to poor transmitter design or adjustment
than to operator error. CW operation seems to be an afterthought with
modern commercial rigs, so it's often poorly implemented. I'd be willing
to bet that if all CW operators tuned the incoming signal to make a
precisely 700 Hz tone, there'd still be a lot of them off frequency
simply because the tx shift isn't properly designed or adjusted.

7441. 3SK74L FET and Yaesu's

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-03 02:26:05 UTC
From: 2w8ji@contesting.com
Message-ID: <3c0adeda.56813098@news.akorn.net>
Source record: 48338

Help please! I can't find any detailed information on a 3SK74L on the web. I need a data sheet for the 3SK74L!!

I wonder if anyone has looked at the IF section of a FT1000?

FT1000's have a big hiss when using narrow filters. In my FT1000D, the hiss comes from the 3SK74L 455kHz AGC controlled IF amplifier following the last narrow filter. That FET is just before a 3SK74L mixer that converts the 455 to 100kHz.

The 100kHz is used for a conventional bridged T notch filter, and then on through more gain to the detector.

The problem is the 100kHz IF section has virtually no selectivity and very high gain, and the first 3SK74L in the chain is noisy enough that when the narrowest filters are used the hiss from the first 3SK74L almost overwhelms the noise from the antenna (even on 160 meters) when the band is really quiet. I can barely hear the front end noise change if I listen carefully on a dummy load with a narrow filter, because of that broadband hiss.

Installing a 0.5dB NF GASFET in place of the 3SK74L helped the noise several dB, but I'd like to get a data sheet and see how bad the 3SK74L really is. The same type of FET is a major contributor to broadband noise from the FT1000 transmitter, they use one in an ALC controlled stage after the SSB filter in the transmitter, and that is the major source of TX broadband noise.

Either those are poor FET's, or they are doing something wrong!

Thanks for any suggestions or help.

David,

I looked up a reprint of Oleg's circuit that appeared on the web and in a qrp journal. There is the tapped coil you mention in Oleg's Micro 80, but no mention of winding data or coil tap placement. There are several versions of the circuit out there, Pixie, Pixie II...

In two versions, "A Swedish Pixie" and "The Pixie II", both have the same keyed emitter- to- ground final. The drain of the transistor connect to 12V through a 10 to 22uH choke. Where the choke connects to the drain of the final transistor there is a 10nF cap feeding a simple "pi" network.

I hope this helps. If I have not been clear, send me your address and I'll copy the small collection of Pixie - Micro 80 circuits I have.

good luck,
Tim (wc1f)

Looking at some application notes for the 78xx series voltage
regulators for using with a detachable battery to feed the regulator
and having a large capacitance on the load side. When the main battery
is detached, the capacitance (or small backup battery on the load
side) will backfeed the regulator for a while.

The recommendation was to put a normally reverse biased diode between
input and output. When the main battery was detached, the diode would
conduct and keep the input at about 0.7 V below the output, thus
preventing damage.

This could be applied to a normal NPN series pass power supply by
connecting a reverse bias diode from the main filter capacitor to
output, thus keeping the reverse bias voltage across the series pass
transistor below 0.7 V when the mains is down.

The drawback is that an idle current is consumed by the power supply.
Thus, even if the load has some kind of low voltage cut-off, this idle
current would load the empty battery.

One other approach of float charging a battery would be to use a cheap
car battery charger (with a quite high internal resistance :-) and use
a shunt regulator across the output, consisting of an NPN power
transistor from output to ground and a zener from output to base and
possibly a resistor from base to ground to sink any colector-base and
zener leakage. The internal resistance in such car battery chargers is
so high that no extra series resistors are usually needed. When on
battery power, the shunt regulator draws very little current.

I've seen many designs of preselectors I want some advice on a design.

design 1
uses a varicap and 5 fixed inductors(molded chokes with a 5 position switch.
in a metal box

design 2 uses a varicap and a continuous air wound inductor with 5 taps with
a 5 position switch in a plastic box.

Is one better than the other ?
I also had thought of using homemade torroid inductors

thanks

The problem with that, as stated before, is the corrugated hose will restrict airflow. You want to use as large a hose as possible with as little flow restriction as you can get away with. Automotive or aviation air/radiator hoses should do the trick.

it seems to work for my FT-902, but I didn't know exactly the proper
tuning before studying the instruction book thoroughly. It seems also
a very bad problem that manufacturers are not qualified to write
proper manuals. They can't explain it so engineers understand what is
important, and they cannot explain for amateurs, but you pressumeably
need to be engineer to see the proper facts.

I made thorough tests and it seems that even when using DSP-9 with
100Hz bandwidth it is no problem with offset, but I really never use
the RIT (clarifier) during HF CW contests, it shouldn't have more
tuning range than +/.0.5kHz for contests and 1.5kHz for normal QSO,
this is complicated to implement, some degree of operators don't hit
my frequency and it is just to forget about them

But for my own use I still would be interested to see a stroboscope,
another possibility is the XY-scope with one tuned circuit.

****

A general answer is that it would depend on the respective
Q's of the inductors, and the "loaded" Q of the tuned circuit
they are forming.

For instance, inductor Q's of 200 are not uncommon in air wound
units. Inductor Q's of 50 are not uncommon in molded chokes.

If the tuned circuit which is being formed has a loaded Q of
10 or 20, there will be very little difference in performance.
(The circuit using the higher unloaded Q's will have less loss,
but with high unloaded-to-loaded ratios, there won't be much
practical difference)

The molded chokes are easier to use. If they have high enough
Q's, I would use them.......

But, in this case, "better" is very subjective ----- i.e. smaller,
cheaper, less loss, easier to replace, easier to document, etc......
----- just depends........

If you are designing your preselector primarily for GAIN, the front end
can be wide (lower loaded Q) without much loss. If you are designing it
for SELECTIVITY, you need to use the highest Q components you can
find to maximize your unloaded/loaded Q ratio ......

So,,,, it's a tradeoff...... Either goal is valid...

Good luck.

OK Bob: I will defer to your knowledge of the type of batteries
concerned. I was talking last night to someone who also mentioned the
13.8 as the normal voltage for 'car type' lead acid batteries. I think
the output voltage of the alternator on my vehicle is 13.8? Must check
it again sometime.

I guess this WAS more of an automotive type situation than 24 cell
telecommunications batteries of my experience; which typically were a
nominal 48 volts (2.0 volts per cell) floated continuously at 2.17 volts
in North American (ATT) practice etc. and typically at at 2.15 for
British systems.

Thus:
24 cells @ 2.17 = 52.08 volts.
24 cells @ 2.15 = 51.60 volts.
24 cells @ 2.30 = 55.20 volts.
This last figure was considered a charging voltage and only employed if
the batteries had been subjected to discharge, due say to a power
outage. The specific gravity, of several, or at least one 'pilot' cell.
was monitored on a regular routine.
If and when the batteries were 'on charge' measures were taken,
depending on the type of power system, to either disconnect the load or
to insert a device to oppose the extra approx. 3 volts between the
batteries and the load, so that it did not affect the operation of the
equipment.

On the discharge side, the equipment, generally, would operate down to 46 volts or even below.
This range of 46 volts to 52 volts was reasonably standard in the telecommunications industry: After all it was a difference of six volts which at around the nominal 48 volts was a variation of more than 12%!

The other factor was battery life; for well maintained batteries 12 to 15 years was on the low side. Twenty was good and we had several strings that were 26 years and older. Never felt that the technicians who maintained these batteries ever got sufficient credit for those installations which achieved long lives; they were obviously doing something right.

By the same token we had one installation where the float voltage was too high. Consequently the overall equipment voltage was too high! Although it would fall immediately to 48 volts (2.0 volts per cell) if discharge was necessary! When management insisted that it be reduced to the specified level (2.17 volts per cell) the foreman was against it! Turned out ALL the equipment in that location had over a period of some ten years gradually been adjusted for the overall higher voltage and he was concerned that it would fail more often and spoil his 'Trouble Index"! That battery was gassing more than others and distilled water had to be added more often. Sure enough that battery installation, even though the location also had a backup diesel/electric generator, so that it had rarely been actually discharged, was one of the earlier ones to require replacement!

Thanks for all the comments. Terry.

Hi,

I have some variable capacitors and other RF components in stock.
Stock is always changing, but you might find just what you are looking
for. Find descriptions and pictures at my web site - www.demostenes.no
Click on the English flag on the left side of the opening picture and
on 'odds and ends' in the menue.

Best regards,

Arnold Goks

DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

==========

Sorry can't agree. If you are designing for greatest selectivity
what is needed is a HIGH LOADED Q. With good desgn this can be a
large proportion of the unloaded coil Q. It can never exceed it
of course.

Download program SELECT1 from website below to model the most
simple but effective form of receiver pre-selector.

That's the sort of thing I'd suggest. This question has come up
plenty of times before, and I and others have posted comments
previously; a check http://www.groups.google.com with "SN76514"
as the keyword will save some reposting.

The last time I posted some suggestions, Peter Bertini suggested/stated
that the 76514 may have better dynamic range than the MC1496. I've
never seen the data sheet for the TI device, and the only times I've
seen it in the ham literature, it's been promoted as an easier
to use device rather than having special specs. The SN76514, like
the MC1496 and the NE602 (and other devices) use the "Gilbert Cell"
scheme. How they are biased would be the difference between the
signal handling of each of these. The MC1496 requires a lot of
external resistors for biasing; the SN76514 puts it all inside
the package. Simpler, though the input and output impedances are
then preset.

TI changed the number of the device at one point, I can't remember
which came first. The other number for the SN7651 is the TL442.
I never saw anything to indicate that the specs changed.

The last time this came up, I suggested that the MC1496 might be
a functional equivalent (you'd have to build a module with
external resistors). Or build one up with discrete transistors.

I don't know if you could get the transistors matched sufficiently.
But you could get transistor arrays, maybe they are no longer available?,
and build up a "Gilbert Cell mixer". Such a scheme did show up in
QST a couple of times years ago.

The real question here would be the application (making up a sub
would be fussier as the application became more stringent) and
whether this is to replace a faulty IC (where some consideration
would be required), or if someone needs to build a mixer or
balanced modulator, and decided the SN76514 would be the thing
to use. If the latter, an MC1496 would most likely be fine.

See Single Sideband Principles and Practice, it has a complete treatise on preselector/postselector design. ARRL sell the latest release from Mcgraw Hill.

Q plays a very large roll in the performance of a preselector. Likwise dont overlook the IMD performance of all the components, especially the inductors if you plan to use ferrite. Most of the advanced military designs are designed for transmitters and receivers at about the 100 milliwatt level. In most cases the components are over size, because the preselector has to cope with second harmonic energy of nearby transmitters. You may try and find a copy of the Harris or Collins HF 80 service manuals. Likwise MFJ is now making preselectors for transceivers and receivers. The best unit is a unit made by Braun in Germany, i am not sure if it is still made. Preselectors make the noise figure of the receiver worst.

I just bought some LED displays from Jameco and need some info on
pinouts (has 10 pins - 5 across on the top and 5 across on the bottom).
These are 2.24" 7-segment displays with right hand decimal point.
Jameco part number is 97199. They have a number printed on them, I
suspect a manufacturers part number of
LSD23265-10. It is the common anode version. Any help greatly
appreciated.

Grab yourself 6 volts D.C. and a 330 ohm resistor and play a bit.
You wont hurt anything, and will learn the pinout for yourself.

If you can't figure this easy task, what will you actually be
doing with them?

7469. freebie 3KVA transformer 208in 230out

A strange beast indeed. Was for connecting across a 208 WYE circuit
and provided 230v output. The output is NOT center tapped I am sorry
to say. It is a 4 wire transformer, 2 in 2 out, and is in like new
condition. The best use I can think of would be to unwind the secondary
down to 110v, or better yet, remove all of the secondary (looks like
#12 enameled copper) and rewind it with welder cable to make a killer
battery charging transformer, or monster 13volt supply for the shack.
The end plates come off of this transformer with 8/32 screws, and the
secondary is so accessable it isn't even funny. It could be unwound
in about 1 hour. It is yours for free if you pick it up in York, Pa.
I am guessing it weighs about 30 lbs. I am not really willing to ship
it unless you can give me a good reason why not to.

reply to onehest@blazenet.net and to get the real reply to address
you must substitute 1 for one. de-spaminator thing, you know.

That's exactly how I do it. I actually have a 9volt batter
with about a 1K resistor and some leads soldered to it, so I can do
this sort of thing, along with testing single LEDs.

Interestingly, I've discovered that there often is a standardization
to LED readouts. So if there's a number, I'll see if there's
a match in my ECG replacement guide; if not, I just look at
similar pinouts. It can save a bit of time if you assume it's
got a standard pinout, and then set out to prove the assumption.

But while commercial programs (Orcad, Protel,...) may have extensive
libraries, as soon as you are going into analog or mixed signal
circuits and you are not using opa, ttl or cmos logic, you still need
to create a lot of schematic templates or pcb footprints by yourself.
And sometimes (Protel) the libraries look ok at the first glance, but
then you find that for instance the templates for transistors do not
match any of the transistor footprints because they used completely
different names for the pins...
If you need to create your parts anyway, you can do it with a
free/shareware program too...

Sounds like it is from the era when various systems were changing from
230 delta to 208 wye (star)? So that trans. may very well have been to
step voltage back up to 230, when 208 3 phase was introduced?
In the 1950s we had a whole building that was fed with three phase delta
and ONE of the phases was centre tapped to get a neutral for two
supplies of 115 volts, both from that one phase. So we had 4 wires
coming in that 'looked' normal! But;
If you inadvertently used that centre tap neutral and the 'hot' of the
wrong phase you got 'funny' voltages!
I agree it is odd, in a way, that transformer doesn't have a centre tap
on its 230 volt side.
Yours might have been one of a trio used to interface 3 phase 208/230
volt systems.
Interesting discussion. As you say it sounds like it could be used for a
variety of purposes. For example you could unwind half the secondary and
rewind it in parallel with the other half so as make a 230 to 110 volt
isolation transformer spreading the load over both 115 volts legs of a
normal North American 115/230 supply?

Even with no modificaions, it could be used as an isolation
transformer for either 240 or 120. Also usable in a power supply
(voltage doubler circuits, etc, supplied from either 120 or 240.

Just because it has enough turns to be usable on 240 with the core
doesn't mean it can't be used at half the voltage input.

The slight voltage step up would be insignificant in most isolation
applications.

I am surprised it is rated at 3KVA if it only weighs 30 lbs.

>Tom W8JI

Hi Tom,
According to the ECG manual, here are the specs...

Trans-conductance gfs typ umhos = 22,000

Gate to source cutoff voltage Vgs (off) Max V = G1=2 G2=0.7

Zero-Gate Voltage Drain Current Idss mA Min - Max = 0.5 - 8
(Vg2s=4V)

Gate to Source Breakdown Voltage BVgss Min V = 20 (Bv DSX)

Input Cap Ciss Max pf = 3.5

Transfer Cap CrssMax pf = 0.03

Device Diss. Pd Max mW = 200

Case Type = RF-15A

ECG Part Number = ECG455

Case Pinout = Placing the long pin at 12 o'clock, this is the Drain.. going clockwise, at three o'clock is the Source. Going clockwise again, at six o'clock is Gate 1. Going clockwise again, at 9 o'clock is Gate 2..

I have used ECG parts many times, (I prefer factory originals though, if available) and some parts are not an exact match, but close enough to work. Anyway, the info they provide is usually pretty accurate.. Anyway, I hope this helps.. Tony, WB8MLA

7478. ? Very small glass cased Variable caps.

Newsgroup: rec.radio.amateur.homebrew

Hi all. I was digging around and found some very small variable capacitors. They are about a 1/4" wide and 1 1/4" long and like a ferrite rod tuned type but the rod on these is brass and the rod slides inside a small clear glass tube. They look from the 30s or earlier? They were made by JFD Mfg. in Brooklyn, N.Y. Anyone seen these before. Very neat! You can see em at this URL:

http://home.jps.net/~jonnysocko/IMG_0294.jpg

Very common part used in 1960s,70s,80s,. I have JFD catalog from 1981 and
they are listed. I wouldn't be too surprised if they don't still make
them. Good stable caps.

Tom

have you made any thoughts about gain distribution? Perhaps too much
gain after the device, or too little signal level input? It is a
reason for using such high conductance fets, and gasfets have usually
worse intermodulation, so I wouldn't go for your solution

Not really worth the trouble. First off you would have to rebuild it and the final stages might not make it to 52Mhz. Second..you will have to "FM" it RX and TX. Next you would have to install some kind of offset osc or switching to get the 500/600Khz offset for RPTR use...and after all this you have a 4 watt rig. Do yourself a favor..just buy the Alinco 20 watt 6 meter rig..it's a bargain for the money...Eddie

hey rob
i wouldnt waste the money on converting it that HT is only an AM transserver
and there just isnt much 6 meter AM stuff
those articale you seen where to convert a SSB rig to 6 meters
and with the price of the MFJ 9406 under $300 new and under $100 used its hard
to justify spending the money to convert an old CB radio
also if you have an HF rig already tentec sells a transvert for around $150 i
think it is you can find those used as well for under $95
good luck

Actually, it's not tied to the radio at all. It is a stand alone box
that has 6 thumbwheel switches that I manually set to display the
frequency I am on in the mobile. It has the switch box on the dashboard
and the LED display in the back window of the van...conected by
multi-conductor cable with DB-25 connectors on each end.

I think you are on the right track. The 3SK74 is used in the ring mixer of a fairly well known radio which escapes me at the moment. As they are hard to find, there have been a few attempts to substitute other FET's. As I recall, the universal conclusion was that the NF of the '74's was very high. I don't trust my memory (and the first poster didn't give the all important NF), but 3.5 dB sticks in my mind.

Sorry to not have all the details, but it wasn't my fight to fight at the time.

Chuck

There were FM Walkie Talkies that were considered CB's that operated on 49 MHz, which people have converted to 6 Meter use. This is what you have probably heard of.

It's not practical to convert an AM 40 channel CB HT to 6 Meter use.

Are you an amateur? Assuming your a tech, you might want to explore the 70CM (440 MHz) band. There may be some repeaters in your area, and will have more activity then 6M. 6M is one of those bands where you have to wait a month for 15 minutes of use, but those 15 minutes are fun. Another choice might be the 220 MHz band, as its starting to get some activity.

As for equipment, there are some nice dual band (2M/70CM) radios that you can get for under $200, like the Icom W32:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1305333657

or Tri banders (6M/2M/70CM) like the yaesu VX-5R:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1304754723

If you plan on getting you General ticket, and want a nice rig that has 6M on it, look at the Alinco DX-70TH. It's a 100 W, 160M thru 6M mobile rig that typically sells for under $400 used:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1305466082

The DX-70T is the same rig, but only has 10 watts on 6M.

Hello Rob,

There are some really nice rigs out there now that cover six meters. Some inexpensive, some not so inexpensive. There's a new single band six meter mobile by Ranger Communications. It's a model RCI-5054DX. It runs a good $300 brand new though, but I'm not sure what your looking to spend. There are other multi-band radio's nowadays, but they run much more in cost. There are also many used single band six meter radio's on the market too, so you'll have to keep your eyes open for what you want. An example would be the Yaesu FT-100D or the Icom IC-706MKIIG. They both incorporate 160 meters all the way through 70 centimeters. The nice thing is they have plenty of power on each band and they operate in all modes. The downside is they cost plenty too. But when you think about all your getting they really are a good deal. You get an HF, 6 meter, 2 meter & 70cm radio all in one! But again, only you can determine what you can spend. That's where most people opt to go for a cheaper setup. But you'll have to decide. Good luck to ya!!

I have an Icom 706 and would like to use a multiband vertical to run as many bands from it as possible. I would like to build one, and or purchase one to place atop my 40ft tower.
My question boils down to, can anyone offer a design or a product they really love?
Thanks
Kevin AB8IU

The most popular conversion I have seen is for a Cybernet chassis conversion
to 6m. However, it is fairly complex conversion. For $300.00 you can buy
the new RCI 5054DX and get a compact all mode rig that will do everything
you could ask for, except cost the same as an Icom, Kenwood or Yaesu......

CB's are easily convertable to 10 meter rigs but 6 meters is a big stretch.
If you want something to convert to 6, I suggest you look for an older low
bad business radio. There are still some around. This will be much easier
to convert and give you FM capabilities.

Adding a frequency readout to a CB radio is possible, but it isn't a good project for an inexperienced homebrewer. And, in the end, would be pretty pointless. You only have 40 channels on a CB. It would be easier to just look up the channel number on a chart to find out what frequency you are on.

However, adding a display to a older short wave receiver might be useful. Take a look at the digital displays on "http://www.aade.com/". The displays handle many different brands and are pretty easy to hook up. I have one at home.

If you want to do some homebrewing, however, think up a project that will add some utility to you equipment. Then, fire up a search engine and hunt around the internet. There are dozens of sites with schematics and instructions for many projects. A good start would be:

Harry's Homebrew at "http://hem.passagen.se/sm0vpo/"

Information for Halo may be found in old antenna book or VHF manual,
but I would rather use a Big-wheel. The advantage with halo is only
that it has lower windload when used on the car, and I learn that halo
has some new users today for this reason. I've mounted the big wheel
on the car, but it was much windload, particularly on the German
Autobahn, so I had to return to my old J-Beam Halo

Problem with halo is low gain, but when the car is moving it may be
even lower. For use at home it seems no good reason to use such
low-gain antenna, bow-horn antenna is better and nearly
omni-directional. Wisi had one for sale 30 years ago, and we copied
it, but I can't find the drawing today.

Some of my friends with space limits at home find the DL7KM biquad
very useful, but it seems not to have 10dB gain as somebody claims

Another antenna to be considered for horizontal polarization is
Abe-Lincoln aerial

Regarding six meter activity --

There is plenty of six meter activity. The past three or four weekends the band has opened up very nicely, from Michigan here to Alaska, Hawaii, and even into Europe. A friend of mine worked a number of stations in Europe over the past two weeks. That's all on SSB.

On FM, there are a number of places to find activity, such as 52.525 simplex. I monitor this frequency all the time, and over the course of the last couple of years have worked 20 or more states right there. There are also repeaters on six meters around the United States.

For me, six meters is my favorite band. I enjoy all modes, mostly AM and SSB, as I have a number of vintage rigs I like to get on the air. They call it the "magic" band, and over the 8 or 9 years I have been using it, I can certainly agree with that.

Maybe I need to clarify myself... ;)
I know lots of people who enjoy working 6meters...
I was mostly wondering why a beginner's wanting to 'go there right off the bat' before even getting a license..... It's a fun band for some, sure..
But if it's challenging for old-timers, well....
Sort of like going down the "killer-slope" before even trying the bunny-hill..

Source record: 48209
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I started in Oscar Satellites with an automated Station consisting of a FT-736R, Kansas City Tracker/Tuner computer interface, KLM Twist Oscar antennas with polarity switchers, and a 6m module added to the FT-736R. By coincidence, I decided to try 6m one day during an opening and contest, occurring simultaneously. At the onset, I didn't even know what a grid was. I knew my Lat/Lon, and soon discovered it was a rare grid due to over 75% being in the ocean. Add that to the fact that it hadn't been represented by any active hams in quite some years. Over 2 hours later and 150 contacts, I managed to clear the first pile-up. Considering how nearly impossible it would be to experience the same "popularity" on HF within the CONUS, I can only say that 6m is the magic band and one that helped me "cut my teeth". I soon found that Satellites were more boring than HF, although more dependable for keeping skeds. I then moved onto weak signal terrestrial work on SSB and digital formats. It is hard work, requiring an understanding of propagation, weather fronts, proper antenna installation and orientation, coax loss at higher frequencies, proper grounding and RF shielding and demands courteous operation at all times. I soon found that the "Cream" did surely "Float to the top", as the best operators were above 50 MHz. However, your mileage may vary; you may be content to only work HF due to the minimal amount of effort necessary in setting up a station and the fact that you will make more contacts by mistake that you would make on purpose above 50 MHz. There is a lot of this going around, and it's affect on the hobby is becoming more increasingly noticeable......

In other words, Shoot High, accept nothing less and help preserve the future of Ham Radio by keeping abreast of technology and finding new ways of communicating effectively. BTW, you won't find this on HF, and it is unlikely you will make a big difference by relying on the repeaters.

If you are serious on converting CB to 6m, I have a few mods here on file that are quite complex, but are supposed to yield satisfactory results. If you feel that you will enjoy 6m AM operation, I would recommend the RCI 5054DX, due to it's design incorporating High Level AM Modulation, and the ability to have the dual output section operate in a true linear fashion by modulating only the Driver on AM. SSB reverts back to AB1 and the AM Audio quality should be heads and shoulders above the regular approach to AM by the other manufacturers.

You can also look for HF offerings to be appearing soon in the American market, based on "Export" chassis 10/11m rigs with either one more or one less stage of up-conversion to put them in the Ham bands. I know Maycom has a 40m rig out slated for sale under $300.00 and it incorporates the same design as the RCI 6m rig does. This is one of the benefits of the efforts spent to police 11m with valuable Ham Radio assets; the influx of affordable

gear into the Ham market by manufactures who had too much invested in their production process to shut down due to outside pressure. I couldn't say if these will be as "tight" as a Kenwood/Icom/Yaesu; but at 1/4 to 1/3 the price.....

As others noted, they are piston caps. They for sure are still made
and used. Voltronics (www.voltronicscorp.com) is one manufacturer,
for example. They are kind of a "little brother" to vacuum variable
caps...some piston trimmers actually have nesting multiple concentric
cups like the vacuum variables. The modern ones have high Q, low
parasitic inductance, good stability, and (because of a nearly linear
C versus turns and several turns) good settability. A very simple
form used to be used in television tuners: a ceramic cylinder with
threads inside and a plated outside. There was a screw that went
through a spring-nut on the opposite side of the metal chassis they
mounted on, and the screw position tuned the cap: cheap ceramic
cylinder, common 6-32 screw, spring-nut and a double-flatted hole
punched in the metal was all that it took.

Cheers,
Tom

Me too! I have a transformer rated at only 600VA that weighs a bit
more than 30. I know HP used conservative ratings, but not THAT
conservative. (And my 5kVA isolation transformer is well over
100lbs...)

Cheers,

hi kevin well if radials are not a problem the hustler hf6v is what i would use. its built well enough to with stand high winds. although the gap is a popular antenna i would stay away from it, i have had two different models here and without guying after the first wind storm they tend to develop quite a lean to them, i also had much better dx performance with hf6v.

A 'good vertical' is, in my opinion, an oxymoron. I've tried verticals and none of them comes close to even a wire dipole in performance. All the big signals from DX stations come from horizontal antennas.

Yes you can work DX with a vertical. But it's a struggle, and lots of wasted calling.

Just the opinion of an old timer who has been there.

73, Bob

The vertical has a lower take off angle Bob, therefore it is better for DX..
That first skip is a long one.

O.K. I weighed it. It weighs 54 lbs. I have gotten strong as an
ox now that I drive 18 wheeler, and make about 20% more money than
I did as a professional broadcast engineer.

The unit BTW is made by AJAX transformer of Hackensack New Jersey,
and is an 'industrial control transformer' and is rated 3KVA CCS.

I just wish it had more useful voltages for the things I want to do,
and I wish someone would come get the thing. It is taking up space
here, and being that it is in 'as new' condition, I don't want to just
throw it in the dumpster.

7523. Re: Do you have a good Multi-band Vertical?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-06 10:59:13 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <3C0F4F81.74146B4@eznec.com>
Source record: 48220

I always shudder when I hear antennas compared solely on the basis of "takeoff angle", as though all the antenna's radiation happens at just one angle, and the gain and patterns of all antennas are the same except for "takeoff angle". It doesn't work that way at all. And just because an antenna has a lower "takeoff angle" doesn't even mean it's stronger at its best angle. Take for example a quarter wave vertical with a *perfect ground system* compared to a half wave dipole up 30 feet, both at 14 MHz, over average ground. The "takeoff angle" of the vertical is 27 degrees, the dipole 33 degrees. Which is better?

Well, for starters, the field strength from the vertical, its best angle of 27 degrees, is +0.2 dBi. The field strength from the dipole at the same angle is +5.8 dBi. That gain difference is as much as you'll get from some 3 element beams, and more than you'll get from any 2 element beam (manufacturers' claims notwithstanding). And the dipole is better despite the lower "takeoff angle" of the vertical.

Take a look at the field strengths at other elevation angles, and you'll see that the dipole wins at all useful angles --

ELEV ANG DEG DIPOLE ADVANTAGE DB
5 1.5
10 3.1
15 4.3
20 5.2
25 5.8
30 6.3

Now, does this mean that a dipole is better than a vertical? No! It means that of the two antennas and conditions I'm comparing, and for communicating in a direction broadside to the dipole, the dipole beats the pants off the vertical. At different ground conditions and frequencies, the advantage can well go to the vertical, especially at some elevation angles. And even under the narrow set of conditions I set up, the vertical beats the dipole by 10 dB at some elevation angles off the dipole's ends. While you can fairly compare a rotatable horizontal beam with a rotatable dipole with a single gain number, there's no way you can describe the differences in the three dimensional radiation patterns of two very different kinds of antennas with a number or two -- unless you're only interested in one direction -- azimuth and elevation -- and for a specific frequency and set of ground conditions. You'll be like the statistician who drowned while crossing a creek whose average depth was only three feet. People feel a strong need to simplify complicated concepts. And all too often, the simplification leads to wrong conclusions.

If you want to learn more about what antenna patterns really look like,
and why "takeoff angle" can be so misleading, download the free EZNEC
demo program from http://eznec.com. I guarantee you'll learn from it.

Rob,

You are exqactly right, so don't let other's comments get to you. 6 is a great band. Good DX possibilities, virtually all modes, small antennas, and available radios for modifications and home brew projects. The only thing you have to watch out for is TVI. Its right beneath channel 2 and you can easily cause problems with neighbors or your own TV.

Have fun with it. That's what this hobby is all about.

Wow!
someone else using Schema by Omation.... I used it for quite some time
and found it matured into a pretty neat proggie. Especially when they
started to support post-script output. What really forced me to choose
another package was that the computers tended to be "too fast" making
screen scrolling a pain, jumping from one side to another.

So, what to choose today?? Well it depends, if your need is to use the
schematic as an input to a PCB-program, use a package i.e. PADS or
Orcad or what ever. If you are only interested in drawing neat
schematics use something simpler i.e. Visio or Corel Draw.

Cheers

I'm looking at putting a computer into my car (embedded pc type), and was looking at how I'm going to power this thing. The board needs a minimum of 5.6A at +5V, and with a couple of extras, I'll likely be pushing close to 7.6A in the end. There will be times when the computer will be sleeping, and pulling less than 500mA worth of power at these times.

Anyways, one of the things I was looking at are DC-DC converters with a nice wide range input (9-18V), and a fixed 5V output. However, most of these don't go up to the 8A range, and according to the people that make them, using 2 of them to divide the power through them is not really possible. Also, these things tend to be EXPENSIVE, I was hoping for something a little more palatable...

Along came the suggestion of using an LM1084. This looks attractive, but I'm unsure if this will still give out 5V, even if the input is less than 5V. (For 5V this will not be too much of a problem, as a car with a supply voltage of less than 9V is pretty much dead anyhow, but I may need a 12V supply in the future as well, and there are very good chances that the 12V supply voltage would go lower than 12V during starting, etc.)

Also, the LM1084 only does 5A as well, I'm not sure if I could gang 2 of them in parallel to get roughly 10A (maybe slightly less due to uneven current distribution?) through them?

Anybody have any ideas?

--Toby.

45MHz in, 2 x 2pole xtal filters, conversion to 455kHz, 2 x 2 pole ceramic
filters, discriminator, and FM audio out. Also received signal strength out.
It appears as if the limiter may be defeated by adding resistor to lower
gain of limiter stage into linear region.
30kHz nominal BW and approx -110dbm sensitivity.

Source record: 48231

DC-to-AC inverters are now readily available and getting pretty cheap, and the surplus dealers can't seem to give away 5VDC power supplies. So you might consider using this combination. It would make it easy to add a 12V supply in the future, too, by just plugging in another surplus supply. This wouldn't be very compact or portable, but it would be really quick to get going, and not very expensive.

Automobile ignition systems can have some really hair-raising spikes from time to time, and temperatures inside a car can be extreme. Homebrewing a regulator to handle this environment reliably isn't a trivial task.

I could use one or two for spares for my JRC NRD515 receiver, which uses
one. Are we talking a lot money? I would think we could get
a few others to join in as well.

Can anyone tell me if the SDU5500pan display will work in conjunction with the Ten Tec 340. I don't mean control the 340 but just show me a section of the selected frequency. The Ten Tec340 has an IF out, Mixer 1 out, Mixer 2 out and signal monitor socket. or must I buy a Spectrum Analyser. The total cost would then be prohibitive. I would welcome any suggestions...
Terry (G8ZQC)

Special valves for sale:

The following valves are for sale. They are unused unless otherwise specified, and mostly in original boxes. They are all in stock and can be shipped immediately to anywhere in the world.

2 pcs 3069M Large, round CRT in super heavy duty packing material each in a wooden barrel. One in

completely ew, obviously never unpacked (only

by me for inspection), the other one seems also to be new and unused but it has been opened by someone. Price: US$ 150.- each

8 pcs F16-10LD CRT by GEC (some boxes says 'Haltron' on the outside. I have not opened to verify). They are obviously all unused.
Price: US$ 100.- each

1 pcs F16-10LD CRT as above, but made by Mullard.

Price: US$ 100.-

1 pcs F16-10LD CRT as above, but this one is used. It has a little spot on the screen. Price: US$ 50.-

4 pcs 7BP7 CRT. The boxes says 'Haltron' I have not looked inside. Unused and unopened.
Price: US$ 100.- each

5 pcs 5FP7 CRT. The boxes says 'Haltron'. Some are opened and some are sealed. All the valves are

obviously unused Price: US$ 50.- each

6 pcs P535/1E STC pulse modulator valve. Also coded CV 427. It is similar to 715C. All unused.
Price: US$ 50.- each

1 pcs P535/1E Same as above, but this one seems to be used.
Price: US$ 30.-

6 pcs C1148 EEV pulse modulator valve. Unused and in original boxes Price: US$ 50.- each

12 pcs C1150/1 EEV pulse modulator valve. Unused and in original boxes Price: US$ 50.- each

3 pcs C1166 EEV pulse modulator valve. Unused and in original
boxes. Price: US$ 50.- each

1 pcs QF 451 Ferranti. Looks like a radar TR switch and unused.
Price: US$ 20.-

1 pcs KS 9-40D Mullard klystron. Unused in sealed box Price: US$ 20.-

4 pcs M509 EEV magnetron. Also coded CV 3982. Unused in
sealed box Price: US$ 50.- each

2 pcs M599 EEV magnetron. Unused in sealed box
Price: US$ 50.- each

1 pcs JP 9-75 Mullard magnetron. Unused in sealed box
Price: US$ 50.-

7 pcs 24B1 STC trigatron valve. Unused in original box (Strange
looking valvel) Price: US$ 30.- each

11 pcs 725A Western Electric magnetron. Unused in sealed boxes.
Price: US$ 30.- each

E-mail me if interested. Offers are also welcome.

Hi Art,
Heres the data from the ECG Replacement Guide

Part Number : ECG1474

IC-FM Amp, Vcc = 12 V Typ, Vg = 34 dB

CASE - 7 Pin SIP

Pin 1 - HI INPUT

Pin 2 - LO INPUT

Pin 3 - BYPASS

Pin 4 - GROUND

Pin 5 - NC

Pin 6 - OUTPUT

Pin 7 - Vcc

Usually, the ECG spec info is pretty accurate, however, I perfer
original parts when i can get them.. Hope this helps.. Best luck
then..Tony WB8MLA..

Thanks Tony, Im trying to modify my TM-201 for T hunting, this gives me a start. Im trying to reduce the gain of the reciever.

Hopefully reducing Vcc will do the job. I suspected pin 7 from the service manual.

Is there a place on the web with this info? Someone sent me a web address but I can't ever seem to get through.

cul Art.

former Washington resident, hopefully soon to be one again.

Indeed ,whatever system you use in a car whether DC to AC to DC or DC to DC conversion ,ensure that upon starting the engine the power supply for the computer from the engine battery is switched off (perhaps through a time-delay switch). If it is necessary to keep the computer switched on ,then you could use another battery which is diconnected from the main system upon starting the engine.

The same applies to mobile phone chargers inside a car , these should be switched off (unplugged) when starting the engine ,or at least the mobile phone should be disconnected.

========
In the UK a good solution for this application is 100 mm (4 inch) diameter
plastic sheet (spiral steel wire supported) hose used with bath room and
kitchen
extraction fans ,available from most D.I.Y. (Do it Youreself) stores and
kitchen
centres.

> none of them comes close to even a wire dipole in performance. All the big
> signals from DX stations come from horizontal antennas.

What band ? 20m? I can believe it there. I bet that doesn't work out
the same on the low bands. Most of the big dogs on 160 and 80 run big
tall verticals for transmitting. The bigger of the dogs phase more
than one. Even on 40m, my best dx antenna by far was a vertical. But I
can't put a dipole more than about 40 ft up.
>
> Yes you can work DX with a vertical. But it's a struggle, and lots of
> wasted calling.

What do you consider a "good" vertical? Judging from your description
of their merits, it doesn't sound like you've ever used one. What you
say may apply more to the high bands, 20-10 more than anything. Sure,
most have big yagi's that maul verticals. But on the low bands,
usually the vertical is king unless you have the means for large
arrays. Also depends on how high you can get the dipoles. Here, I
can't go much over 40 ft. On 40m, my vertical ate my dipole for lunch
on long haul stuff at those heights. But my vertical was a full sized
1/4 wave ground plane 36 ft at the base with sloping radials. Not one
of those lossy commercial jobs. Makes a big difference. When I had
both and working dx, the struggle was when I was using the dipole. To
VK, I came up about 3-4 s units when I switched to the vertical. Every
single night. The only time the dipole was best was on short to medium
haul stuff.
>
> Just the opinion of an old timer who has been there.

Well, I was there too, but my results didn't seem to match yours.
Verticals get a bad name because many people use lousy verticals with
lousy radial systems. I recommend using both dipoles and verticals and
being able to switch. But you have to use a realï¿½ vertical, not a
sears vertical. Mine wasn't quite optimum, but at it's height "36 ft
with 4 radials" it was about equal to a ground mount 1/4 wave with 60
full size radials as far as ground losses. I would have needed 8-10
radials to equal the classic 120 on the ground scenario. That GP I
used would make the average GAP vertical look like a grossly
overpriced dummy load. But at nearly 70 ft tall counting the mast, I
guess not for the faint of heart...MK

How do *most* car RF keyless entry systems work? My 93 T-bird for example. I'm not out to boost someone's car, I'm sure the low tech approach of using a slim jim or breaking a window would be more status quo anyway.

Is it just a low power carrier, if so that would be supper cheesy. I would hope that theses more to it than a freq counter could crack.

==========
I have checked my car key fob . It complies to UK 'MT 1340 WT Licence
Exempt ' and operates on 433.96 MHz (so right in the 70cms Ham band)

The spec MT 1340 (applicable to the UK) says that comms distances of up to
50 metres are permitted.
The sig of my key fob is pretty weak . My handheld radio (HT) can hardly
detect the (probably pulse modulated)sig at a few metres distance . Also I
have to get near the car in order to operate the door locks.
Previous systems incorporated Surface Acoustic Wave (SAW) technology ,
perhaps this model still does.
If I hold the fob approx 1 metre away from the HT's 'rubber ducky' I can
only hear the sig ,between 433.945 and 433.970 MHz
I have not checked the width of the rx (inside the car) with my HT.
But I do know that in Germany and the Netherlands ,people have been
prevented from entering their car due to amateur radio operations in the
70cms band. However it is possible that these (older?) systems only involved
a carrier.
The newer systems clearly involve some form of (pulse ?) modulation , as
used for telemetry applications.

In the UK some other (licence exempt) freqs used for remote control purposes
are 40.685 , 418 and 863-865 MHz

My Logitech wireless keyboard and mouse seem to operated in the 863 -865 MHz
band. If possible at all I'll try to establish the actual freq(s) . used
I also have a remote headphone set which operates on 863.500 - 863.750MHz
(adjustable)

The above just for info

Hi Art,
If there is a place on the net for this info, I sure don't know about it.. I have heard that (for a price) you can sign up for this info and tech sheets online in .PDF format, however, I don't know where the site is, but I have heard it is quite expensive for the member fee... Anyway, what I do is just buy the actual ECG Semiconductors Master Replacement Guide (where I got the info for you) which is a softbound book about the size of a phone book, but only about an inch and a half wide.. However, it contains all of the neat stuff.. Cross refrences, pictures, pinouts, descriptions, values, etc. Actually, I'm ready to buy another one myself, because this one is four years old now.. Cost is $5.95 US, and just the pinout info has saved me many times.. Anyway, you could write ECG to buy the book, heres the addy>> Phillips ECG 1025 Westminster Dr. PO Box 3277 Williamsport, PA. 17701 This may be a hassle tho.. Anyway, the place I buy all of my hard to get parts here in northern Ohio is Euclid Radio Parts, and the Phone number is 440-585-5115 They always have these softbound ECG books in stock, and they ship worldwide, UPS, Fed Ex, your choice.. I also know they have have similar software stuff for computers, Motorola cross refrence, (which I bought) Its OK, just info, no pics.. But, I still perfer a book I can look at, instead of the puter screen.. Good luck then!! Tony, WB8MLA..

I'm no expert on this, just what I've read hear and there, but is'nt what your describing Doppler shift radar?. Like what is used in speed radar guns I am looking at a Ramsey catalog and there is a $99 dollar radar gun htey have had out for awhile.
Doesn't Doppler work by measuring the frequency difference between the sent and returned signal. I forget but so many Hz = 1 mph. Ofcourse, this wouldn't do any ranging. I guess you have to measure return time for that.

Also, there is a real good book I got from the library called "The Invention That Changed the World", a history of radar development. No indepth technical stuff, but very interesting reading into the different people/organizations involved in it.

Yes.

>for that.

Or scan the transmission frequency at a very high speed and measure
the frequency difference between the transmitted and received
frequency. This can be used to get the distance (+/-speed) between the
transmitter and the object. By scanning both upwards and downwards,
both the distance and speed can be determined.

The 433 MHz is the ISM (Industrial, Scientific and Medical) band.

Some standard chips can be found at www.nvlsi.no, go to Wireless Communication to see some standard components, such as one-chip tranceivers. They seem to support up to 20000 bps FSK modulation at a maximum output level of 10 mW.

Also some types here in Aust use Holtek trinary encoders.

Often the signal bandwidth is significant. Some only switch the
carrier. There appears to be quite a range of RF/modulation
approaches.

Just working from memory:

Model #: "SFA10.7M", not "SAF10.7M" (I think)
Bandwidth: Approx. 280 KHz @ 6 dB rolloff
Impedance: Approx 300 ohm
Loss: Approx. 4-6 dB
Phase linearity: ??; not sure it's specified
Driving circuit: Most FM radio chips are designed for this kind of part.
Pinout: Center pin is common (ground); other 2 pins are interchangeable

They're probably pretty inductive. While they may work in the
broadcast band, I doubt that they'd present a resistive load at the
higher frequencies.

The part number is correct. Here are the details which I have for the
SAF10.7MC-Z:

Centre frequency:
10.7 +/- 0.03 MHz (red dot)
10.64 +/- 0.03 MHz (black)
10.67 +/- 0.03 MHz (blue)
10.73 +/- 0.03 MHz (orange)
10.76 +/- 0.03 MHz (white)

3db Bandwidth 190 +/ 30 kHz

20dB Bandwidth 500 kHz maximum

Insertion loss 22 dB max (this is correct)

Spurious responses -33dB max

GDT 0.5 mirosecond bandwidth 300kHz minimum

Sorry, no impedance data or driving circuit. Perhaps someone else can help..

A few years ago, there was one that you programed manually using
switches and a power supply. I'd like to get the schematic for that. I
think one of the manufacturers during the early days of EPROM's had an
application note on it. I can't find it. If anyone has info on it I'd
appreciate it also.

With nearly all of the HF rigs coming with six meters today,
six meters is nowhere as lonely as it used to be.

Small antennas with unexpected band openings, good local
propagation and even repeaters give the band a "flavor" of
its own. It's not HF with all of the power freaks and it's
not two meters with the handi-talkie only crowd either. I've
always preferred six meters over the other bands. Then
again, no one has ever called me "normal" either...<G>

You need a sophisticated tool like Agilent ADS that uses
harmonic balance techniques. Brute force SPICE won't
work because the problem is too large for it. I have
used both Microcap and ADS.

From: Rick Karlquist <richard@karlquist.removethis.com>
Message-ID: <DdYQ7.23194$wL4.60554@rwcrnsc51>
Source record: 48183

I spent several months A/B'ing a 90 ft high inverted vee
against a ground mounted vertical on 40 meters. On hundreds
of off the air signals, they were almost always of equal
gain. This gain was at whatever angles of arrival the
typical signals come it at (which are the only angles that
matter). Apparently, NEC is pessimistic in terms of modeling
verticals and the effect of ground, because it would predict
that the inverted vee would beat the vertical.

Were the antennas far enough apart that they don't couple significantly?
People with two close spaced antennas don't really have two antennas --
they have one antenna with two feedpoints.

RADIO HABANA CUBA
DXERS UNLIMITED

WEEKEND EDITION
SATURDAY, DECEMBER 8, 2001

By Arnie Coro CO2KK

Send your comments, questions and ideas to: arnie@radiohc.org

Hi amigos, welcome to the weekend edition of your favorite radio hobby program, our special for radioaficionados around the world! I am Arnie Coro, radio amateur CO2KK now ready to share with you today about seventeen of air time....

AND here is Item one: Another meteor shower just around the corner....remember that the very late evening and early morning hours of your local time are the best to benefit from meteor scatter propagation... Radio meteors should provide an excellent opportunity for TV and FM band Dxers to add many more stations to their logs, while amateur radio operators on the 10, 6, and 2 meter bands will enjoy yet another opportunity to work this unsual mode....

Item two: Solar activity still high enough that the ionosphere is still supporting very high daytime maximum useable frequencies, so expect more 6 meter band F2 openings during the next two to three days... So far this fall season has proven to be the best for 50 megahertz ionospheric propagation of the whole cycle 23.

Item three: Many e-mail messages received here dealing with homebrew radios, a topic that has brought a lot of attention from both regular and new Dxers Unlimited's listeners... Today, I'll continue telling you more about homebrew radio designs, and why your home built radio designed for experimenting, may outperform even very expensive commercially built receivers....

And as always at the end of the show, our HF plus 6 meters propagation update and forecast will be reaching you to help plan your operating schedule amigos!!! Margarita Delgado is my sound engineer and producer, I'll be back with you all in a few seconds...

This is the weekend edition of Dxers Unlimited reaching you during a very special weekend HF propagation, as a matter of fact, conditions are as good as any long-time short wave listener can remember amigos!!! TV DX enthusiasts should keep their VCR's rolling to pick up those very rare,

but possible, F2 layer refracted signals that are only seen during the peak of the solar cycle... YES, if you have the appropriate type of receiver, capable of receiving different TV broadcast transmission standards, it is possible to pick up TV DX that reaches your set not via the typical sporadic E mode, but via the much longer range F2 single or multiple hop modes. Imagine watching Australian low band TV in the Caribbean, or picking up a New Zealand TV station in Buenos Aires, well all this is possible when the F2 MUF goes above 45 megaHertz and higher!!!

Don't forget to keep a log of your TV DX and make at least one copy of those unique VCR tapes whenever you happen to be lucky enough to pick up one of those elusive F2 TV DX openings. And, please do share your experiences with the worldwide audience of Dxers Unlimited by sending your comments about the F2 TV DX openings e-mail to arnie@radiohc.org or via FAX to the following number 53-7-705810....

Now here is item three of today's edition of Dxers Unlimited... more about homebrew radios: Well, amigos, it's nice to see that this topic has generated such a great interest and also to realize how creative our listeners are.... I want to say again that I have received several very interesting e-mail messages about the power supply and the front end of the SUPER REGENERODYNE homebrew radio, and some of them are really funny... like the listener who said, "Arnie why attempt to build a NEW receiver using vacuum tubes for the front end?" so I decided to answer both, directly to him via e-mail and now on the air...

Amigo, if you happen to live in a part of the world where thunderstorms are frequent, as we do here in the Caribbean, then you will know why many radio amateurs have lost not one, but two or three or more times their front end amplifier devices... MOSFET's are particularly delicate electronic components, no matter how you try to provide protection for them... And there are two radio frequency amplifier circuits that perform at least as well as the best MOSFET in the frequency range from the Low Frequency bands all the way up to the 50 megaHertz, amigos. One is the standard classic pentode RF amplifier stage, and the other one, that I like best, is the cascode, using dual triodes or a pair of individual triodes.

Well, again, I want to tell you that there was another e-mail that came in from a Dxers Unlimited's fan that told me that he had already built a better supply than the one I described, because his supply uses a fully electronically variable and regulated high voltage power unit, using a technology that was very popular during the nineteen-fifties at the microwave radio relay systems sites... To all of you interested in homebrewing your own radio gear I just want to say something... there is nothing like operating a radio set that you have built yourself, no matter if it is a single transistor crystal set plus audio amplifier, or a sophisticated dual or triple conversion receiver!!!

Now, let's move ahead with today's description of the DREAM RADIO's detector stages, that are capable of receiving AM, CW,SSB and Narrow Band FM signals... After testing many different regenerative detector circuits,

I decided to settle with the very easy to design, assemble and operate Hartley type classic triode detector, which uses a cathode tap to the grid coil in order to provide the required feedback to make the detector operate. My other choice is the use of a small tetrode or pentode vacuum tube that provides the advantage of easily controlling the gain of the detector stage by changing the tube's screen voltage...

The DREAM radio has the possibility of choosing from up to four different detectors, a standard AM envelope detector using a vacuum tube diode, a detector using a triode connected as an infinite impedance configuration, a regenerative detector and, last but not least, a classic discriminator type FM detector...

Yes, I agree that this adds one more switch control to play with, but please realize that this is an experimental receiver, a radio that provides a lot of enjoyment to the operator by playing around with the careful adjustment of its operating parameters!!!

The Hartley regenerative detector has an amazing sensitivity and stability, and it operates even with extremely low plate and screen voltages. By the way, both plate and screen voltages are regulated, adding to the stability of the circuit, that can be taken very, very near to the point of oscillation, where the Q of the tuned circuit is extremely high, and kept there to provide razor-sharp selectivity when receiving CW Morse Code Signals. As regulated voltage is available, the infinite impedance triode detector is also fed from the regulator, but of course the diode detectors do not require plate voltage to operate!!!

More about the DREAM RADIO's different detectors after this short musical interval... Amigos you are listening to the weekend edition of Dxers Unlimited, you can send your signal reports an comments via e-mail to arnie@radiohc.org and Via AIR MAIL, a postcard will be fine, to Arnie Coro, RADIO HAVANA CUBA, HAVANA, CUBA.

Now, more about the detector stages used in my DREAM RADIO EXPERIMENTAL MODULAR RECEIVER!!! The detector stages are all fully enclosed in a shielded compartment, with the plug in coils properly spaced away from the walls of the compartment so that the Q or factor of merit of the coils won't be degraded by the proximity of the metal shield... The coils were designed for the highest possible Q, and I have wound them in both very high quality ceramic coil forms and easy to work with PVC drain pipe coil forms, without really noticing any difference in operation between the two types of coil forms, at least in the range from 500 kiloHertz all the way up to 10 megaHertz...

Anyway, as you have heard or read, the SUPER REGENERODYNE'S detector stage normally operates in the range from 2 to 4 megaHertz or near to this frequency range... The idea of covering just 2 megaHertz per band is to provide a very good calibration that holds for each of the bands, as the crystal-controlled front end simply mixes the incoming signals from the antenna down to the 2 to 4 megaHertz range... In other words, your regenerative detector is always tuned from 2 to 4 megaHertz.... In my

DREAM RADIO, I do not use a crystal-controlled front end all the time; that is, I can change from the crystal-controlled oscillator to a variable frequency oscillator, something that must be done so that FM reception is possible... In other words, the FM discriminator type detector operates at a fixed frequency of 4.5 megaHertz that was chosen because of the easy availability of 4.5 megaHertz TV sound intermediate frequency amplifier transformers, so you do need to do the tuning by changing the frequency of the front end's local oscillator.

As I have said here at Dxers Unlimited many times, regenerative receivers are ideal for homebrewing and their tolerance for parts values is outstanding.., but combining conventional super-heterodyne technology with a regenerative detector stage is a really nice approach to homebrewing a sensitive and low-cost radio. But the DREAM RADIO was not thought as a low-cost project, as anyone attempting to build his or her own version of the DREAM RADIO will be willing to spend quite some time and shopping around for the specialized components required for the project.

Next Tuesday and Wednesday UTC days, during our regular mid-week edition of this show, I will continue describing my DREAM RADIO -- another hybrid receiver that uses both solid state and vacuum tube components to achieve outstanding performance while keeping things rather simple and easy to assemble, even for old timers who have a hard time working with miniature electronic devices!!! Because in these designs absolutely no attempt was made to miniaturize the receiver and modular construction was used, so that a lot of experimenting can be done without spoiling already fully operational, well-tried and proven modules...those that you want to keep intact after all the experiments.

Well amigos, I hope you are enjoying this step-by-step description of my latest radio receiver project, one that has drawn from the experience of many enthusiastic radio experimenters around the world who have made the wonderful gesture of sharing with all of us the results of hundreds of hours of hard work.... And as a local radio amateur here in Havana told me a few days ago, one can start building a simple power supply and a regenerative receiver for the 80 and 40 meter bands, that is also capable of tuning the very popular 6 megaHertz international short wave broadcast band, using recycled components to keep the cost of the project pretty low... Also, these radios are ideal for showing at the radio club's meetings and keeping one right next to your store-bought, professionally built receiver will not only help you realize the amazing sensitivity that they have and their razor-sharp selectivity when properly adjusted, but also will provide that additional radio that is so nice to have when chasing for DX without losing the broadcast time of your favorite radio hobby program!!! Without forgetting the fact that the basic receiver will work nicely as the TAIL END of a nice front end converter!!!

And now amigos, as always at the end of the show here is Arnie Coro's Dxers Unlimited's HF plus 6 meters propagation update and forecast... Solar activity will probably go below the 200 solar flux units mark very shortly, but the ionosphere is in such a healthy state that very high

daytime maximum useable frequencies are going to continue happening during the next several days....

Ten meters was open Friday from shortly before sunrise here in Havana to hours after sunset. Now scientists are talking about a second peak of cycle 23, something will equate this cycle with cycle 21 for its level of activity... Expect very nice propagation conditions on an almost round the clock basis this week, and don't forget to at least monitor an empty FM broadcast band channel during the upcoming Meteor Shower. You can leave the tape recorder rolling and then come back from your visual observations of the shooting stars... The same holds for an empty VHF low band TV channel if you are fortunate to have one in your locality, just leave the VCR running.

Attention 6 meter band operators, this is a special advisory for YOU!!! Chances of worldwide 6 meter openings are very good both on Sunday December 9th and Monday December 10th, so be on the alert looking for those nice DX stations that are populating 6 meters nowadays!!!

And don't forget to send me your signal reports, radio hobby related questions and comments about the show to arnie@radiohc.org or VIA AIR MAIL, a postcard will be OK, to Arnie Coro, Radio Havana Cuba Havana, Cuba.

You might look at SerenadeSV. I haven't used it enough to know whether it can
do what you want but it's worth a look. Heck it's worth having even if it can't
do varactors...it's free.

I'm curious, what type antenna and number of radials? Also how much of
that was long haul dx? I always had fairly medeocre results with
ground mounted verticals because I never could lay out enough radials.
I had up to about 30 at one point, and even then it was only about
equal to my 36 ft dipole at 2000 miles. Only after I elevated the
antenna did it really come to life. Was like day and night.
Thats why I'm wondering how many radials you had. Being I had such a
large difference between grounded and elevated, that leads me to
suspect a large number of radials is really needed on a ground mount
to really live up to it's expectations. Also my ground conductivity in
this area, "Houston" is very good in general, so other areas should be
even more critical. It sounds like it was doing fairly well if it was
keeping up with a 90 ft high dipole, but actually I'm kind of
surprised the vertical wasn't the better of the two on very long
paths. For some reason, assuming all heights, gains ,etc, being
equal, I think vertical polarazation is superior to horizontal on low
band long haul stuff. IE: If you had a dipole at 90 ft, and a 1/4
ground plane at 90 ft or whatever height to have the antenna currents
on both at the same appx height, I'd have to bet my money on the GP
winning the race. I also notice the same thing about the modeling. I
have to set the ground at VG to get close to what happens here in the
real world. If it's set at the default "avg", I come up short from
what I've seen using them here. I'm serious as heck about the
comparison of my 36 ft dipole and the 36 ft GP to dx. The GP tore the
dipole a new one every night without fail. Even just halfway across
the country to CA was a solid 2 s units on the average rigs meter.
Only to medium distances such as here to Ohio or something like that,
were they close to being equal. O f course , in the daytime, the
dipole was the winner to short haul 95% of the time. Next time I throw
that thing up, I'll try to do more detailed gain comparisons that mean
something..I don't have it up right now. MK

7591. ARRL Radio Designer Replacement?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-10 13:57:17 UTC
From: jim.bolinger@lintek.aeroflex.com
Message-ID: <8d5ec8a2.0112100557.46ec653d@posting.google.com>

This show you how much I pay attention to such things....

I was going to ask Santa Claus for a copy of the ARRL radio designer, and started looking through back issues of QST and QEX. No luck, so I looked at the ARRL web site only to find that it was discontinued in 2000!

Is there anything that has replaced it at a reasonable price? What's everyone using now?

A steeper learning curve but SerenadeSV is what you want. It's actually more powerful and developed by the same folks (Ulrich Rohde and friends) that did ARD.

Best of all, the price is a lot lower; $150 lower actually, which means it's free!

http://www.ansoft.com/about/academics/sersv/index.cfm

When I initially tried to download it I couldn't complete the download. I contacted ansoft and they sent it to me on cd. Is that reasonable or what?

Merry Christmas.

ARRL Radio Designer was a cut-down version of the Harmonica software, which later evolved into the Ansoft product Serenade. When Ansoft released the free Student Version (SV) of Serenade, there was no more need for ARRL RD.

The ARRL website now recommends you download the free SerenadeSV software which N7WS mentions in another thread:
http://www.ansoft.com/about/academics/sersv/index.cfm

Serenade has a steeper learning curve than ARRL RD, but also a much more powerful program. Advantages include schematic capture (create a model by drawing its schematic), device data from external files, and non-linear analysis to predict harmonic and IMD levels (but that needs non-linear device data, which are only publicly available for a relatively small range of devices). Online help is massive (read: s l o w).

Serenade SV will run existing ARRL RD netlists, but will not display schematics.

Leland,

Good luck even using Harmonic Balance. Your main problem will be getting
a good, reliable model especially for a power (>10 dbm) device. You may
be better off doing it the old fashioned way of build with tune-all networks
and tweek to max. Doesn't sound too eloquent does it? Welcome to RF. :-)

Peace, Love, Dope,

Steve

Thanks, Wes.

I was looking at Serenade SV, but was concerned about its
capabilities. So, I guess it does more than Radio Designer did?

I am concerned about the limited number of devices you can have. Is
that a limitation? Another question....Can you add your own devices
(even if they are not nonlinear)?

==========
Following this topic with interest .....about 12 yrs ago I had some experience with a multiband Butternut (I know ,perhaps not one of the better verticals) at a fellow amateur's place ,sitting in the middle of a small back garden lawn. Initially it had no radials just a copper spike as earth. The results were interesting but not very exciting . However after covering the lawn with galvanised chicken wire mesh (area approx 70 sq metres = about 750 sq ft) ,results improved dramatically on some bands some 2 S- points. , @14 MHz and up . I don't have any info on ground conductivity at that location.

After 3 months the mesh was overgrown and when the lawn was mown over the wire mesh was hardly visible .
The year thereafter it was no longer visible at all.

Just for info.

I was hoping not to have to build anything. That was the goal behind doing the simulation. I have a book on tunnel and varactor diodes with a section on frequency multiplication using varactor diodes. The calculation procedure used is a harmonic balance type, i.e. you keep looping through the solution until the calculated solution matches the assumed solution for the harmonic content of the diode current waveform. Oh well looks like it might be time to get out the solder iron.

Arnie,

Fascinating stuff, especially on the homebrew "regenerodyne" receiver and the TV DX F2 possibilities. I know from watching this newsgroup (rec.radio.shortwave) you have a lot of fans who enjoy your show. As far as I know, your show is unique among major SWL broadcasters by going into a level of technical detail and into ham topics that other shows shy away from. Rest assured there's a contingent of fans here who really enjoy your show's approach.

As I've remarked in the past, a lot of us think you could put together a working radio from a cardboard box, some wet twine, a razor blade, and candle wax. :)
It's refreshing in this day of "plug and play black boxes" that some still understand that part of the fun of radio is building your own, and understanding how it all works.

Speaking of static and lightning resistance of tubes, I would imagine Cuba has quite loud thunderstorm static during the summer months. Have you done any experiments with tuned loop antennas for HF receiving, especially in the higher HF range which is traditionally not thought of as a good place to use loop antennas? It would seem such a design would provide some protection against static and could perhaps null out some local lightning noise, giving a signal-to-noise ratio advantage?

73, and thanks for posting!

From: Roy Lewallen <w7el@eznec.com>
Message-ID: <3C158652.D635C62E@eznec.com>
Source record: 48107

Sorry, the LM359 is a different sort of critter. It has a very low impedance input, while the LM358 has very high impedance inputs. It would be possible to redesign some circuits to use one in the place of the other, but there are a lot of applications where this wouldn't be practical. I suggest finding an LM358 to use. They're readily available.

What I like is that, true to any 10KW rig, when it is turned on all of the local power transformers start smoking....

==========

Well done, and it shows an impressive amount of dedication to take the time to build that properly.

I just tried it and it only requires JavaScript, not Java to be enabled.
Netscape allows you to enable them separately. Other browsers may not.

I agree that you need to be careful and I feel that no one should surf
the web with Java or JavaScript enabled, although, for the most part
JavaScript is pretty safe.

When I surf, I only enable JavaScript when necessary and, if a site
requires Java, I leave. It's not important enough to me to open my
machine to some web site.

You also need to be aware that a download of Harmonica and Symphony is
about 50 MBytes. Not a big deal if you have a high speed connection, but
if you don't, the download will take a while.

->I'm particularly interested in the low noise GaAsFET pre-amp for 70cm in the
->ARRL hand book 1990, Chapter 32-3, using the Mitsubishi MGF1402.

Do a websearch for "olimex". They are in Bulgaria, and they turn out the best and most inexpensive onesie-twosie boards I've ever used. They do, however, require gerber plots, so unless you are willing to lay out the pcb in a pcb drawing program, they won't do you much good.

Was it REALLY necessary to spam 7 newsgroups to get answers?

Better yet, get a GMRS license for your home. That way you can go up
to 50 watts. GMRS radios can also talk to FRS radios. That way your
whole family will be able to work under 1 license. If you go HAM,
everyone in the house will have to have their own license. Plus, GMRS
has repeaters. You can talk all over town depending on the
availability in your area. Your only other alternative is to get a
mobile unit. RadioShack sells them for 50 dollars. It uses a full
Quarter wave whip, and has twice the range of the hand helds.

Since my change was all after the narrow filters, and since it lowered noise floor while gain remained the same, how can my solution be bad?

How can you have IMD or overload when any signal reaching that point is filtered, and also dorectly will control AGC?

Seriously, it actually improved BDR and IMDR because it reduced noise floor without disturbing anything ahead of the narrow filters.

Thanks for all the answers. NF was what concerned me, and if Chuck's memory is correct then that explains some of the problem. (of course I'd still like to find a data sheet for the 3SK74L).

There was one definite problem I saw with the 3SK74L FET. That problem was to reduce gain Yaesu reduced the voltage on the gate of the FET by tapping it way down on the IF transformer.

Since the crystal filter driving the FET can be all over the place in impedance, that will leave the gate terminated in all sorts of wild impedances depending on frequency. It runs the FET wide open, and simply feeds it with less signal voltage and probaly a pretty wild impedance change with frequency.

What I did was use a lower transconductance FET (thanks Tony for the info) reducing gain, which allowed me to move the gate up on the transformer. The FET was also much quieter, and moving the gate up on the transformer helped even more!

Anyway, the rig is MUCH better at digging weak signals out of noise now, and I can actually remove some front end gain now for the same S/N at the output. The annoying hissing is greatly reduced, so I don't have to override it with gain ahead of the filters.

Of course I'd still like t find a data sheet for the 3SK74L...hi hi.

Paul,

At first I didn't understand about "scanning" to get the range. But,
then I thought it might have to do with drastically changing the
frequency and timing the time it takes to see that new frequency
reflection's on the receiver?
Is that thought in the right ballpark?

I am looking at an article from the Febuary 1985 issue of Byte magazine
of a simple eprom programmer that uses about 8 chips a crystal a few
other discrete components. It had a 24 pin socket and you made jumper
blocks for each eprom type.

I know it works because I built one back then. It works off of the
serial port and the source code for DOS basic is in the article too.

If that's the one that does the work with logic rather than a cpu,
it can be simplified if you have a parallel port in your computer
to connect to the programmer. The one I'm thinking of has a UART
(which is what the crystal is connected to) for converting serial
to parallel, and then the rest of the unit in fact uses parallel
data.

The one I'm picturing, I'm too lazy to look for that issue of
Byte, was in Steve Ciarcia's monthly column. He covered
the matter of eprom programming a number of times, as eproms
and technology improved. Since many/most of his columns in
Byte, for some years at least, were republished in a number of
books, perhaps one could be lucky and find it at the library.
I think books may be likely to hang around longer than old
magazines.

There isn't anything particularly difficult about an eprom
programmer. You have to set up the address where you want
to program next, have the byte you want to put there ready,
and then send a pulse to the programming pin. The pulse on
the programming pin, and the length of the pulse, varies
depending on the device being programmed. The address can
be anything from a bunch of switches (which would be really
slow and tedious) to a set of counters that advance on a pulse
(which is probably what the circuit you are pointing to does),
to a parallel port of enough bits in a computer. Likewise,
the data byte can come from a set of 8 switches (tedious), or
a parallel port on a computer.

The complexity of the hardware depends on how much you want
to do in software. If you have enough parallel port bits
in your computer, you can basically do it all in software.
The "programmer" would merely be a socket for the eprom,
and a bit of circuitry to pulse the programming pin, and a

power supply. The computer would keep track of the address
data, send a byte of data to the eprom, pulse the programming
pin, and then wait the required time, and then send out the
next address, and continue.

Shift some of the software to hardware, and you get like that
circuit, where there is a string of counters to address the eprom's
address lines. The computer doesn't have to output the address
data, just sending a pulse to advance that hardware counter.

The ultimate programmer would be a standalone computer (Steve
Ciarcia did one of those), where you send the data you want
programmed, and it does all the work.

Or you can go for simple hardware, and no software. Just switches
and not much else but the pulse circuitry and power supply. But you
have to keep setting up switches, for both the address and the data,
and after a few hundred bytes, you're bound to make mistakes.

The software is really more important than the hardware. Look
in old computer magazines, and there will be plenty.

The way to do this is to FM modulate the transmitter, with a sawtooth waveform. Frequency mix the transmit signal with the receive signal and do an FFT of the result. There will be a spike corresponding to the distance of each target. (Of course, there are a lot of details I left out.)

I think my company makes (or will make) such a thing (it is in a different department).

> transformer?

Hi Matt,
microwave ovens usually have power ratings 600 watts or more. The
transformer must carry that energy plus magnetron losses when the oven
is on, i.e. for tens of minutes continuously if the oven is set to
maximum power.
So you can expect power rating of the transformer 600 - 1200 watts
continuously. The secondary voltage is usually 2 - 4 kilovolts
(WARNING - ABSOLUTELY LETHAL !!), the secondary amperage you get by
simple division and should be somewhere about 600 / 2000 = 0,3 amp. No
current limiting is involved in the transformer.

Hi, Bill,

I read your message as wanting to get a hold of an *original* Heath filter. Your guess is as good as mine there, but if an aftermarket exact replacement is suitable then check out International Radio in Oregon. They have one that fits in the SB-300.

Cool, and shucks!

Saw his reply to me saying to listen to the show *after*
the show was already over. :(I should check my personal e-mail more often!

I do make an effort to catch his show, because it is one of the few
homebrew-oriented shows left on the whole planet. (If not the only one!)

Arnie Coro's absolutely a first-class guy, and you can enjoy his show regardless of
your politics. If you're into learning about how things work, I strongly recommend

a listen, exactly like I didn't do this Tuesday. (It's on Tuesdays and Saturdays.)

Thanks a lot for the heads-up!

So, did he answer my loop antenna question, comment on Caribbean static levels,
read the note, or what, do you recall?

>>tuning to correct frequency, so I wondered if it is a stroboscope type
>....[snip]....

If what you mean by "correct frequency" is "the frequency YOUR radio
automagically listens to when you quit transmitting", it may not be
that THEY are tuning incorrectly but that THEIR radio automagically
transmits on a slightly different frequency than YOUR radio expects.

A few (well, maybe 20-30?-) years ago, there was NO automagic transmit
offset; the USER at each end simply knew how to tune his/her receiver-
-and especially how to use the equivalent of what we now call RIT.
"Correct frequency" depended on how the RECEIVING ham adjusted his/her
(my FIRST contact was with a "her"!) own receiver.

I currently have for sale a copy of "Understanding Radio, A Guide to Practical Operation and Theory" by Herbert Watson, Herbert Welch, and George Eby, published by McGraw-Hill in 1951, second edition. The 716 page hardbound book is in about very good condition, clean with no page tears or pen marks except for a previous owners name inside the front cover. A comprehensive treatment of the radio. Available for $9 plus $3 postage (Media Mail within the US, at cost elsewhere). If interested, please email to "Oldbooks78@aol.com" to reserve. Thanks.

Agree with the illegality of course.
And yet I understand. If you ever used one in any major public area you sure want an edge. These things, which are scorned by "Real Hams", are everywhere one of the new toys. I just came back from WD World in Orlando. (I'm the only Ham in my family). The kids brought their FRS's and sure enough, everytime they turned them on the resulting QRM and splatter made CB/11M sound like 160M with a 200ft. tower and 120 buried radials. Worst of all are those damn pager signals which blat and beep constantly from all the thousand other kids trying to "call Daddy".

When I was a kid my borther and I had a cheap pair of Lafayette Walkie-Talkies and they were tons of fun for the 2 weeks it took to break them. Were I a kid today I would figure that Ham Radio is the LAST thing I'd wanta do as all the crap on FRS is so annoying and confusing if you don't have the base knowledge to figure out what's going on. Truely a pain to hear.

No, but because it was so extensive, the web site it linked to was so
inflammatory, and the intended beneficiary Citibank, I decided to
retire my Citibank credit card.

How long do you think it'll take before 70cm amps have the same
restrictions as HF amps?

Then they'll try it with MURS, and 2m amps will get the restrictions.

Contact Fred at FAR circuits. He may already have the board in his catalog.
If not, if the artwork is available from ARRL or author, he will usually
produce board .. if demand is present.

Hi Bill (and Al the follow up poster)...

You guys need to get on Ebay and have a look around. There are much parts units around of the Heathkit series and crystal filters are often sold there. The cost of a new filter might be a little more than you want to pay.

cheers

Happy Holidays all. I am working on a Cushman CE-4 and need to know if anyone might have a manual that can email or snailmail me a copy of one or two pages. I have found out that there is a problem with a board on the bottom of the unit. The 0710-7001 board had two transistors that went up in smoke. I cannot find my manual for this model and the CE-6 seems to have different boards. It is the fourth board on the bottom front row, counting from the bottom

as the unit is on the bench facing you. It has three pots and a horizontal potted coil, and two IC's on it. There are a bunch of transistors located near the edge connector, toward the right side of the board. I need to know the numbers of the transistors and some of the values of the parts. Thanks Don KB6GQA

RADIO HABANA CUBA
DXERS UNLIMITED

MID-WEEK EDITION
TUESDAY, DECEMBER 11, 2001

By Arnie Coro CO2KK

Send your comments, questions and ideas to: arnie@radiohc.org

HI, amigos radioaficionados around the world!!! Welcome to the mid week edition of your favorite, listener oriented radio hobby program. I am Arnie Coro, radio amateur CO2KK, your friend in Havana, and host of this twice weekly show devoted to the promotion and development of our wonderful hobby... RADIO!!!

Item one: Excellent propagation conditions continue, with the solar flux still nicely above the 200 units mark, and Tuesday the A index was at the very quiet level of just 4 units!!! Propagation of DX signals in the range from 20 to 60 megaHertz via the F2 layer continues to amaze long time radio enthusiasts, that are now seeing what looks like solar cycle's 23 second peak!!!

Item two: The Geminids meteor shower is coming, and this is going to be the most active one until next year's Perseids... Learn more about the Geminid meteor shower right here on this same frequency a little later as Dxers Unlimited's mid week edition continues, and don't forget that the Canadian special SPARK transmission to celebrate Marconi's achievement in 1901 of crossing the Atlantic with a radio signal will be on the air Wednesday UTC day. This is the data about the spark transmission that is going to take place on the 80 meter band. The frequency of the spark signal's center will be 3550 kHz and the time 9pm EST or 02 hours UTC December 12...

So only those listeners who will pick up our broadcasts to Europe and the Caribbean or our first run to North America will be able to be there on time!!! Because Dxers Unlimited's first broadcast to North America is at just after 0130 UTC, so you can switch fast after listening to the show, tune 3550 kiloHertz using the AM mode, and try to pick up this special spark transmission that will celebrate Marconi's achievement 100 years ago!!!

David Wilson VE3BBN in St David's Ontario, near Niagara Falls, obtained approval from Industry Canada for a special event transmission using a

home made spark transmitter. Again the event will take place on December 12 2001, at 9 pm local eastern time, (0200 UTC), to celebrate the 100th anniversary of Marconi's historic transatlantic transmission of the letter "S" from Poldhu Cornwall to St John's, Newfoundland in 1901. The center frequency of the spark transmissions from VE3BBN will be on 3550 kHz and the time 0200 UTC Wednesday, that is again 9 pm eastern or 8 pm central Tuesday Margarita Delgado is my sound engineer and producer, and my e-mail address is very easy to remember... arnie@radiohc.org I'll be back in a few seconds...

The Geminid meteor shower will peak Thursday night/Friday morning December 13/14 offering meteor observers, and radio hobbysts a last chance to see impressive activity until next summer's Perseids. Circumstances are excellent this year for visual observations of the meteors as the new moon occurs the same day as maximum activity. The Geminids can produce more than 100 meteors per hour if seen from rural areas, and at that rate FM band and TV signals bouncing back to Earth will keep This is one of the few showers that is visible during the evening hours as the radiant rises near 1800 (6pm) local time for observers located in the mid northern latitudes. It rises earlier the further one moves north and just the opposite as one moves south.

This shower is observable from the Southern Hemisphere but at much reduced rates. On the night of maximum activity the radiant is located close to the bright star Castor, which marks the head of the western twin. Low rates may be seen as soon as it becomes totally dark. These early meteors will be earthgrazers as the travel the sky many tens of degrees lasting several seconds.

As the night progresses the meteors will become shorter but more numerous. The strongest rates will occur between 0100 and 0200 local time when the radiant lies highest in the sky. That's the time window to have all your radio and TV gear working to pick up DX via the meteor trails. The Geminids strike the earth in a perpendicular angle which produces meteors of medium velocity. Of course this depends on where you are facing and where the meteors occur. Those that occur near the radiant or near the horizon will appear slower than those appearing high in the sky and far from the radiant. The Geminids are the only major annual shower produced by an asteroid. Studies have shown that Geminid meteors are indeed more dense than other showers produced by comets, see that's why the VHF signals bounced from those meteor trails are so strong and seem to provide longer burns.....

QSL on the air, and a very special one to listener Ross Archer, who sent an e-mail that I would like to share with all of you, Ross says:

Arnie, Fascinating stuff, especially on the homebrew "regenerodyne" receiver and the TV DX F2 possibilities. I know from watching this newsgroup (rec.radio.shortwave) you have a lot of fans who enjoy your show. As far as I know, your show is unique among major SWL broadcasters by going into a level of technical detail and into ham topics that other shows shy away from. Rest assured there's a contingent of fans here who

really enjoy your show's approach.

As I've remarked in the past, a lot of us think you could put together a working radio from a cardboard box, some wet twine, a razor blade, and candle wax :)

Well amigo Ross, not exactly, but yes, recycled parts from many sources do provide enough components to build some nice gear!!! Then Ross Archer adds in his e-mail this flattering comment!!

It's refreshing in this day of "plug and play black boxes" that some still understand that part of the fun of radio is building your own, and understanding how it all works.

Ross Archer's e-mail continues by bringing in this interesting topic:

Speaking of static and lightning resistance of tubes, I would imagine Cuba has quite loud thunderstorm static during the summer months. Have you done any experiments with tuned loop antennas for HF receiving, especially in the higher HF range which is traditionally not thought of as a good place to use loop antennas? It would seem such a design would provide some protection against static and could perhaps null out some local lightning noise, giving a signal-to-noise ratio advantage?

Well amigo Ross, SURE, the magnetic loop antennas are excellent "filters" against heavy static,and you can install them at low height in order to provide a certain degree of protection against lightnning, as compared with what may happen when you are using a tall mast or tower...

And yes, amigo Ross, you are right, the directional properties of the magnetic loop, does help to null static crashes from thunderstorms, especially those that are reaching you via ground wave propagation!! Well, amigo Ross, keep listening and also reading the scripts of the show that are made available via the INTERNET and on our Dxers Unlimited website at http://www.radiohc.org/dxers/ as yet another service to the worldwide community of radio hobby enthusiasts.

One hundred years ago Italian inventor Marconi was able to pick up a signal sent across the Atlantic for the first time ever!!

In 1895 Italian inventor Guglielmo Marconi built the equipment and transmitted electrical signals through the air from one end of his house to the other, and then from the house to the garden. These experiments were, in effect, the dawn of practical wireless telegraphy or radio. Marconi was born in Bologna, Italy. His father was Italian, his mother, Irish. He was educated first in Bologna and later in Florence. Then he went to the technical school in Leghorn, where he studied physics. Following the successes of his experiments at home, Marconi became obsessed with the idea of sending messages across the Atlantic. He built a transmitter, 100 times more powerful than any previous station, at Poldhu, on the southwest tip of England, and in November 1901 installed a receiving station at St. John's, Newfoundland. On December 12, 1901, he received signals from across the ocean. News of this achievement spread

around the world, and he was acclaimed by outstanding scientists, including Thomas A. Edison. Marconi received many honors including the Nobel Prize for Physics in 1909.

And now, amigos, as always, at the end of the show, here is Arnie Coro's HF plus 6 meters propagation update and forecast:

Solar flux very near 220 and moving UP now... and a major flare was detected at 0808 December 11th, something that could have an impact later on our magnetosphere. Solar activity is expected to be from moderate to high, and the daytime maximum useable frequencies should exceed 50 megaHertz on many propagation paths.

Medium wave band Dxers should be on the alert for possible signals coming from your South, if your QTH is located at latitudes higher than about 40 degrees North.

A special advisory to 6 meter band operators... there are good chances for really long range DX on that band, and this will probably continue for the next three to five days...

Don't forget to send your signal reports, comments about the show and radio hobby related questions via e-mail to arnie@radiohc.org and VIA AIR MAIL to Arnie Coro, Radio Havana Cuba, Havana, Cuba!

Current Solar Indicies from WWV, 11-Dec-2001 at 1202 UTC
SFI = 219 A = 3 K = 1

Conditions during the last 24 hours:

Solar activity was high. The geomagnetic field was quiet. A major flare occurred at 0808 on 11 Dec.

Forecast for the next 24 hours:

Solar activity will be moderate. The geomagnetic field will be quiet to unsettled.

Solar Wind Data:

Provides solar wind velocity and energetic particle intensity. Updated at: 1421Z on December 11, 2001

Velocity (km/s): 334.0
Density (protons/cm3): 2.7

Penticton Observatory SFI Measurement:

WWV only updates its SFI reading once a day at 2100Z The Penticton solar observatory takes measurements at 1800Z, 2000Z, and 2200Z
(WWV uses the 2000Z Penticton measurement)

The Penticton Observatory SFI value on 10-Dec-2001 at 2200Z was: 223

Three Day SFI and A-index Forecast (updated daily after 2200Z): This report issued on Dec 10, 2001 at 2200Z

Date SFI A-index
10 Dec 215 8
11 Dec 215 8
12 Dec 210 8

Solar Activity Forecast:

Solar activity is expected to be mostly moderate for the next three days. There is a small chance, however, for a major flare or a proton producing flare from Region 9727, especially if magnetic flux continues to emerge.

Geophysical Activity Forecast:

The geomagnetic field is expected to be quiet to unsettled during the next three days.

Recent Major Solar Flare Activity:
(usually reported within 30 minutes of event peak)

Date Time Magnitude
08-Dec-2001 0634Z M3.4

NOAA (American) Sunspot Number:

This number is reported daily around 0225Z and reports the number of sunspots observed in the previous 24 hour period.

The NOAA Sunspot number for 10-Dec-2001 was: 224 Most recent five days (oldest first): 260 226 200 218 225

GOES-8 Background X-ray Flux:

This value is reported daily around 0225Z and reports the average background x-ray flux level as measured by the GOES-8 satellite.

The GOES-8 Background X-ray Flux level on 10-Dec-2001 was: C1

Most recent five days (oldest first): C1 C1 C1 C1 C1

my radio EXPECTS what it must. This means that if you tune zero beat
to my signal your signal will pass through my filters.

Which way you choose is only interesting for yourself. I made some
extensive tests to check that when I tune a signal through my cw
filter + DSP-9 it is exactly zero beat for the opposite station

Using a separate receiver (Drake 2-B) it is an easy check

>2.5W -> 100W
>
>
Have good experience with MRF240, but it really depends on your
friends (neighbour countries). SM6ESG/M Morgan visited me an evening
some years ago, and he insisted that 2.5W from his IC202 to a halo was
sufficient.
But one doesn't have to agree with Swedes, so I got 3-4 hours to build
an amplifier. The drive wasn't more than 1.5W and MRF240 provided 30W,
it will work with almost any simple circuit with some optimization but
not as complicated as shown in Motorola RF Device Data, using readily
available trimmer capacitors - not the impossible values shown in the
handbook - ceramic on input side and compression mica on output side,
with sufficient drive the maximum power is in excess of 40W

7673. Re: modifying a frs .5watt to 1watt

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-14 02:54:36 UTC
From: whagen6@cs.com
Message-ID: <20011213215436.14096.00000151@mb-cn.news.cs.com>
Source record: 48070

changing from half watt to 1 watt wont make any difference in distance, the thing is line of sight, which isnt very far at eyelevel. The power increase at the same distance wont even be noticable, 3 db, less than half and s unit, etc. The only thing that will happen is the circuitry will burn up.

7674. Need Thoradson Transformer specs

AMATEUR RADIO NEWSLINE(tm) REPORT #1269 - DEC 7, 2001

Amateur Radio Newsline report number 1269 with a release date of Friday, December 7, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T.

The FCC says no to a Winter Olympics special call sign and a new Extra class exam starts next summer. Learn what's in it on Amateur Radio Newsline report number 1269 coming your way right now.

(Billboard Cart Here)

**

THE 2002 WINTER OLYMPICS: FCC SAYS NO TO SPECIAL CALL SIGN

An idea for a special events call sign to celebrate the 2002 Winter Olympics has drawn a negative response from the FCC. Tom Schaefer, NY4I, of Sandy, Utah, had requested that the agency allow amateurs Utah hams to substitute the number 2002 or 02 for the 7 in their callsign. This, for the time period preceding and up to though the 2002 Winter Olympics in Salt Lake City. But after mulling it over for a few months the Schaefer says the agency responded with a definite no:

--
Schaefer Here:
In-Q: I wrote a letter...
Out-Q:...as a different prefix.

The letter to Schaefer was signed by D'wana R. Terry. Terry is Chief of the Public Safety and Private Wireless Division of the Wireless Telecommunications Bureau. Among the reasons Terry stated in refusing the special call sign request was that the block of special event callsigns requested did not fall into the commission's special event callsign format. Also, that the request was inconsistent with International Radio Regulations. Schaefer says that he is disappointed at the FCC decision to deny, and also a bit surprised:

--
Schaefer Here
In-Q: The letter I...
Out-Q:...unable to do that.

Does this mean that there will be no ham radio involvement in the 2002 Winter Olympic Games? Not by a long shot. According to Schaefer members of the local ARES groups will be assisting in providing communications for the event. And

there’s a good chance that someone will pick up the ball and get some sort of special call sign using the established call sign administrator program.

By the way, you can hear more with Tom Schaefer NY4I about ham radio at the Winter Olympics on this weeks RAIN Report. Its on the web in Real Audio and Windows Media at www.rainreport.com and by telephone at 847-827-7246. That’s 847-827-RAIN. (ARNewsline(tm))

**

THE ARCTIC WINTER GAMES

Another event called the Arctic Winter Games are also in their planning stages. In this case, ham radio is an important part of the event. Q-New Graham Kemp, VK4BB, tells us the who, the what and the where:

--
Greenland and the call-sign OX1AWG is on the air from Nuuk Greenland as a participant of the Arctic Winter Games going to be held in Iqaluit Nunavit and Nuuk Greenland 17th - 23rd of March 2002.

OX3HX, Rene tells us any Hams bringing a valid License original will be welcome to use the local club station OX3NUK for a small fee. If you would like to have your own OX3-call, ship a copy of the license but they need to have the papers 3 weeks in advance. Hams who like to operate OX/Home call or OX1AWG are welcome too, and have only to show up with original valid license.

For the Amateur Radio Newsline, Im Graham Kemp, VK4BB, of Q-News Australia.
--

For those planning to visit Greenland for the games, Rene Witkowsky, OX3HX will be available at one of the many Help Booths around the city. (Q-News)

**

DX RECORD: 73 KHZ DISTANCE RECORD INCREASED

Yet another new low frequency record has been achieved on the 73 kHz band. Jeramy Boot, G4NJH, has more:

--
“On the 21st of November, just before midnight UTC, W1TAG received extremely slow CW from G3AQC. This was the first time that a complete callsign had been copied, though partial calls were identified the previous night.

The opening lasted around two hours and was the culmination of several weeks of testing. At a distance of 5291 kilometers, G3AQC smashed his own record of 4408 kilometers when his 73kHz transmissions were received by VE1ZJ last June. He was running 200 milliwatts ERP.

The transmission was in Differential Frequency CW, where the dots and dashes are the same length but on slightly different frequencies, and with no space between them.

Jeramy Boot, G4NJH”
--

The Differential Frequency C-W communications system used for this contact holds the promise of extending this record even further. (GB2RS)

**

BREAK 1

This is ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on great bulletin stations around the world this week honoring the Antelope Valley Amateur Radio Club Wednesday Night Net serving Lancaster California.

(5 sec pause here)

**

HAM RADIO IN SPACE: EXPEDITION 4 HEADS TO THE ISS

Amateur Radio is keeping an eye one space this week. On the International Space Station to be more exact, as we witness a changing if the guard. The third group of Astronauts and Cosmonauts headed by Frank Culbertson, is getting ready to come home. They’ll be back on Earth December 16th, after being in orbit since last August.

Expedition 4, Yuri Orufrienko, Dan Bursch and Carl Walz will take over and be up there until next May. Onufrienko once operated from the Mir Space Station; Bursch is KD5PNU and Walz is KC5TIE. So hams can look forward to contacts with them.

Amateur Radio on the International Space Station; ARISS; will continue on the air with two meter voice and packet. Voice contacts with schools all over the world have been well served and those exciting contacts will continue at a rate of one or two a week once the new crew settles in.

In addition to operating ham gear, the new crew has also carried new Amateur Radio antennas to the station. They were designed and built in Italy to Russian specifications, then space-qualified and shipped to the United States.

The Astronauts plan at least eight space walks, two of which will be used to install those antennas outside the crew quarters. They should provide a wide range of frequencies and vastly improved coverage of the ham bands for the ARISS station.

The space station call, while flying over the United States is NA1SS. The 2 meter downlink frequency is 145.80 MHz. Look for the new crew on the air from orbit in the near future. ARNewsline(tm))

**

HAM RADIO TESTING IN THE USA: NEW EXTRA CLASS EXAM QUESTION POOL RELEASED

If you are planning to upgrade to Extra class, now might be the time to do it. This is because a new and somewhat more difficult Extra Class exam will go into

effect next summer. Amateur Radio Newsline’s Norm Seeley, KI7UP, has the details:

--
The National Conference of Volunteer Examiner Coordinators Question Pool Committee has released a revised and expanded set of Element 4 Amateur Extra questions. Use of these questions begins next summer and replace the current Extra class question pool released back on April 15, 2000. That’s the day Amateur Radio ''restructuring'' became effective.

The new Element 4 pool expands the number of questions by more than 20 percent. The new test pool has 806 questions as opposed to 665 in the current Extra class pool. It also contains more technical material. In fact, more than half of the questions cover electrical principles, circuits, signals and emissions.

The 50 questions in an Extra class examination are drawn from the question pool. FCC rules say that an applicant must correctly answer at least 37 questions of the 50 to receive a passing grade.

The new Extra class question pool becomes effective July 1, 2002, and must be used to generate all Extra class written examinations administered on or after that date. The questions are available on the ARRL Web site and will remain valid through June 30, 2005.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.
--

The Question Pool Committee now will turn its attention to developing an outline for the Technician class Element 2 question pool. A draft version is scheduled for public release and
comment next spring. The ARRL website address is http://www.arrl.org/arrlvec/pools.html to find the Question Pool. (ARRL Bulletin, NCVEC)

**

HAM RADIO TESTING IN THE U-K: UPGRADING MORSE TESTS UNDERWAY

Meantime overseas, the United Kingdom is in the process of administering a lot of slow speed Morse code exams. This, following the an announcement by that nations telecommunications agency that U-K Full and Intermediate Class B license-holders can operate on the High Frequency bands under the new Foundation license by simply passing a code test.

Called a Morse Assessment exam, the Radio Society of Great Britain is arranging for sessions to be held nation-wide. The RSGB hopes that at least two sessions per region will take place between now and the end of December.

The RSGB says that these tests are open to both members and non-members of the society. So far twelve sites have been approved for training and testing of the new U-K Foundation License. (GB2RS)

**

ENFORCEMENT: AMATEUR RADIO ROAD RAGE MUST STOP

The FCC's chief ham radio rules enforcer has told those attending the Ft. Wayne Indiana Hamfest that the time for on the air arguments has come to an end. Riley Hollingsworth, the FCC's Special Counsel for Amateur Radio enforcement told the forum that Amateur Radio road rage must stop now and that the bickering on our frequencies can do nothing but hurt Amateur Radio in the long run.

Hollingsworth also says its time for more hams to get involved in public service. Jack Parker, W8ISH, of Amateur News Weekly, has that part of the story:

--
"Hollingsworth says that it is now time for hams to use frequencies responsibly. He adds that now, more than ever, is the best time for all Amateur Radio groups to seek out and establish working relationships with local emergency response agencies.

Since September 11th, Amateur Radio and its potential has moved into a prominent position on the national front. But he stresses that we must move quickly at a local level to establish our place in the overall emergency response plan.

Reporting from the Ft. Wayne Hamfest, for amateur News Weekly, I'm Jack Parker, W8ISH."
--

Hollingsworth's views are echoed by many who are already involved in organizing ham radio emergency communications on a local level. They say you can never have to many well trained volunteers. (Amateur News Weekly)

**

SPECTRUM USE: FCC OPENS UP MORE SPECTRUM TO COMMERCIAL USERS

The government has moved to eliminate a cap on how much spectrum any one wireless company can own in a given market. The decision opens the way for mergers between major carriers and allows them to provide more mobile services such as high-speed Internet access.

The Federal Communications Commission had previously limited the amount of spectrum that an operator could own in a particular geographic area, in an effort to prevent a single giant company from squelching competition in that market. But in a recent 3 to 1 vote, the agency decided to immediately raise the amount of bandspace a company can own from 45 MHz to 55 MHz. This is an increase of more than 20 percent. The FCC plans to completely eliminate the limit in January 2003. (FCC)

**

HAMVENTION 2002: TIME TO NOMINATE REMINDER

Another reminder that the Dayton Amateur Radio Association has opened the nominating period for the 2002 Dayton Hamvention Awards. There are three

awards presented each year. They are the Radio Amateur of the Year, Special Achievement, and Technical Excellence.

All amateurs Novice through Extra are eligible. Awards are decided by the Awards Committee, based partially upon the information received. Magazine articles, newsletters, newspaper clippings, videos and the like are appreciated but cannot be returned. The deadline for nominations is January 31, 2002. Nominations can be submitted by US Mail to Post Office Box 964, Dayton Ohio 45401 or by completing the convenient e-form on the web at www.hamvention.org. (DARA)

**

NEW HAM TECHNOLOGY: THE ELECRAFT RIG CONCEPT DESIGN CONTEST

Want to design the ham rig of the future and maybe win a prize? Well, Elecraft says that it will be giving three of its new EC1 project enclosures to those who submit the most interesting suggested designs concepts.
--
Eric Swartz WA6HQQ: “There’s quite a strong building and homebrewing community inside of the QRP’ers -- the low power operators -- these days. In fact, that is how we got our start.

We have broadened our audience past that and have pulled a lot of hams from the mainstream higher power groups to it also, but those guys (the QRP operators - ed.) build an awful lot of stuff. We are continually seeing folks talking about new project ideas and new things to design. It is quite a fertile group of people so I think we are just kind of servicing that need.”
--

Elecraft says its taking this rather unusual step to away to help stimulate the creative process within the ham radio community. According to Elecraft’s Wayne Burdick, N6KR and Eric Swartz, WA6HHQ, design concepts submitted can be for virtually any ham-related application, but they must be compatible with the Elecraft EC1 enclosure. The EC1 is the same size and color as the K1 transceiver. No schematics are required and designers are under no obligation or expectation to actually build the proposed projects. More information on this unique design contest along with all the rules is on the web at www.elecraft.com. (Elecraft)

**

ELECTRONIC BUSINESS: AILING POLOROID FILES CHAPTER 11

Polaroid has been known to generations of consumers for its instant cameras and film, and more recently as a supplier of digital imaging products. Now Poloroid has filed for Chapter 11 bankruptcy protection.

According to news reports, the company was unable to keep up with the new digital technologies of the photography world. It also has struggled with nearly $1 billion in debt. (Published reports)

**

BREAK 2

News never goes home for the holidays and neither do we. We are the amateur Radio Newsline with links to the world at our only official website - www.arnewsline.org.

**

EMERGING TECHNOLOGY: BRAIN DISEASE SUPERCOMPUTER

The University of California at San Diego will coordinate a consortium of interests banding together to build the first nationwide computer network for studying diseases of the brain. The network will enable researchers to share information on neurological diseases such as multiple sclerosis, schizophrenia, Alzheimer's disease and Parkinson's disease. The National Center for Research Resources, part of the National Institutes of Health, awarded the consortium more than $20 million for the project, which will enable researchers to share brain images via a high-speed network. (UCSD release)

**

HAM RADIO IN SPACE: FREE UPDATED TRACKING SOFTWARE

An updated version of the PREDICT satellite tracking and orbital prediction program is now available. This latest updated corrects some errors that have caused instability under certain conditions in the past. The program's documentation has also been updated, and new versions in Portable Document File and HTML have been added. PREDICT is free software.

The latest DOS version may be downloaded from ftp://ftp.amsat.org/amsat/software/PC/tracking/predict2.zip >. Further information on PREDICT software is available at http://www.qsl.net/kd2bd/predict.html.

Also, new Linux version is currently being prepared for release as well. (KD2BD)

**

INTERNATIONAL - SOUTH AFRICA: NO HT’S IN THIS CAR

Radio Amateurs in South Africa can no longer use a hand held radio in a vehicle unless its attached to a hands free operating system. This is the result of a new law that says that no person will drive a vehicle on a public road while holding a cellular telephone or any other communications device in one or both hands.

To operate mobile, hams and non hams alike now must use a radio permanently mounted in the vehicle and adapted to hands free operation. The law permits mobile radio operators to use such devices as a permanently mounted microphone and speaker or other specialized gear to comply. (SARL, Q-News)

**

INTERNATIONAL-UK: MARCONI 100TH ANNIVERSARY

The 100th anniversary of the reception of the first trans-Atlantic radio signal by Guilermo Marconi at Signal Hill in St. John's, Newfoundland, takes place on Wednesday the December 12th. In celebration, a number of United Kingdom special event stations will be active to commemorate the event.

Most of the operations will take place on the 12th of December itself. Even Great Britain’s Radiocommunications Agency is getting into the act. It will be operating GB100WT from its laboratory site at Whyteleafe, Surrey, during part of December including, they hope, the full 24 hours of the 12th of December. The Radiocommunications Agency expects to be operational on the High Frequency bands as well as 2 meters and 70 centimeters. The station will be operated by Radiocommunications Agency staff in addition to members of local radio clubs and will welcome QSOs with stations worldwide. (RSGB)

**

RADIOSPORTS: WRTC-2002 REMINDER AND UPDATE

A reminder that the next World Team Radiosport Championship will take place next July in Finland. The games will be hosted by the Finnish Amateur Radio Society and the Contest Club of Finland. WRTC brings together over fifty two man teams made up of the best contest operators from around the world. The actual on-the-air competition pits two man teams operating from a common geographic area using identical equipment, power and antennas.

To get a good idea of what goes on at the World Radiosport Team Championship games, film-maker Dave Bell has produced a half hour documentary video titled “The Ham Radio Olympics.” Its priced at only $19.95 and is available on video CD or VHS tape from the American Radio Relay League. More information is on the web at www.arrl.org. (WRTC, ARRL, W6AQ)

**

DX

In D-X, word that wore torn Afghanistan is back on the air following the ouster of Taliban forces from most of that nation. Q-News Graham Kemp, VK4BB, is back with the details:
--
Graham Kemp VK4BB:

“World traveller Peter Casier, ON6TT (5X1T), has been in Afghanistan for the last few days and has now obtained permission to operate in this worn torn nation.

On November 21 he was QRV as YA/ON6TT/M operating in a convoy. The foreign ministry of the Islamic Republic of Afghanistan (Northern Alliance) issued the call YA5T, which can be used on all bands by Peter, ON6TT, Matts, SM7PKK, and Robert, S53R.

Wayne Mills, N7NG, will have to look at the permission, once it is received. His initial reaction was that it should be good for DXCC. Peter will hopefully be contacting Wayne and submitting the documentation. Meantime, look out for these three operating as YA5T.”
--

And late word from the ARRL’s DXCC Desk is that it has already received acceptable documentation for YA5T and has approved it for credit. (Q-News)

Several DX newsletters report that N6TJ is active as ZD8Z from Ascension Island again. He is expected to be there through the 18th of December. QSL as directed on the air. (OPDX, Modern DX’er)

Lastly, word that high seas have forced the Ducie Island DXpedition team to abandon its already-delayed effort to reach that DXCC entity located in the South Pacific. According to the RSGB, the team was some 80 nautical miles from its destination and facing high seas when the decision was taken to turn around and head back to Pitcairn Island. (GB2RS)

**

THAT FINAL ITEM: STRANGE SCIENCE - FAT BIRDS FLY BETTER

About twice a year we bring you stories about radio tagged migratory birds. In most cases its those ever elusive Burrowing Owls. Now we have a totally different kind of bird story. It still involves radio tracking, but this time to see if bigger birds or smaller birds have a better chance to survive in flight. Amateur Radio Newsline’s Joe Moell, KO0V has more:

--
European scientists have discovered what seems like a contradiction about migrating birds. They found that the fatter the bird, the more efficiently it appears to fly.

Researchers at Lund University in Sweden have studied several small species including the Red Knot. In our hemisphere, these 20-ounce wading shorebirds travel 18,000 miles every year, to the tip of South America and back to the Arctic. On the way north, they stop on the shores of New Jersey to feast on the eggs of horseshoe crabs, to build up energy for the last 2000 miles of their northward trip, which they make non-stop. On these binges, the Red Knots can double their normal body weight.

Over the past few years a number of European Red Knots were radio tagged and tracked by the Swedes as they prepared for a similar trip between the British Isles and the Russian Arctic. The study indicates that building up of fat deposits to be burned as fuel during the migration is more than worth the energy that it takes to carry the additional weight. The heavier birds apparently use their muscles more efficiently. Just why this is so remains a mystery. Even stranger is that the results seem to 'fly in the face' of a central theory of aerodynamics -- no pun intended of course.

So what does this have to do with ham radio? Well, it points out that research always seems to yield unexpected results, and it gives me a chance to remind you that dozens of ham operators in western states are listening for the VHF radio tags on endangered Burrowing Owls this winter. You could help out too. Find out by visiting my Web site -- www.homingin.com. Who knows, maybe a ham will make a similar startling discovery about the migration habits of these unique critters. That's homingin -- one word -- for the Web site, homingin.com.

For Amateur Radio Newsline, in southern California, this is Joe Moell - K-zero-Oscar-Victor saying, "no jokes about birdbrains, please."
--

All of this really goes to show that the more mankind uses science to discover the secrets of Mother Nature, the more amazed man is at what he learns. (Ecology Today)

7679. Quad. Detector Coil Adjustment?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-14 11:30:29 UTC
From: "Tim H." <tekphobia@attbi.com>
Message-ID: <3C19E29A.6DBD403F@attbi.com>
Source record: 48076

Hello,

I've got a Ramsey FR146 VHF receiver (it's MC3359 based). I've been using it to receive the NOAA satellites with some (great at one time) success. One thing I'm not to sure of is, what is the proper procedure for adjusting a quad. detector coil? Sure, the manual says, "adjust coil for loudest noise," but that isn't good enough for satellite work. Everything was just right until I got new PC and didn't tinker with radio for a few months.

How I thought I could do it was to scope pin 8 of the MC3359 chip while the receiver is tuned to snow and adjust quad. det. coil so it's centered at 450kHz. Do I need to have a valid signal to adjust the coil?

Much appreciation in advance,

-Tim H.

P.S.
I'm working on converting the receiver to use a digital pot. instead of the old analog pot. (It's a stability issue.) I intially did this with Microchip's MCP42010 (256 taps), but feel the need to use Analog's AD5231 digital pot. (1024 taps!). I've got the pot. rigged up to my printer port and I'm bit-banging the interface in Visual Basic. So, if anyone has this receiver or wants to use a digital pot. for something, I'd be more than happy to share my source code.

I just lost one of questionable heritage in a homebrew 4CX1500 amp, (Not as dramatic as I would have thought although I do need a new set of 5 KV diodes.) Just ordered a new one from Condenser Products in Brooksville, FL. 25 uF, 4 KV in 3-3/4 x 4-9/16 x 9-5/8. I think that's pretty close to the size of the one in the T-bolt.

Talk to their engineer "Gene". He can make one that will operate in any position and they have a VERY nice predicted operating lifetime. (You can operate 24 hours a day and it will still be around after you're planted.)

None of my Thordarson catalogs shows that numeric format. Pre-55 transformers were all 21- or 22- series. Then they started 1A, 2A, etc. I would initially suspect that is a manufacturer's part number, rather than a Thordarson number.

There are probably others with more experience with this than I, but
this is what I would do.

Put a DC voltmeter at the output of the quadrature detector, assuming
it is DC coupled at that point.

Apply an on-frequency unmodulated signal and adjust the coil for 0.0
volts.

7683. FM radar (was Amateur Radar)

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-14 15:57:21 UTC
From: jim.bolinger@lintek.aeroflex.com
Message-ID: <8d5ec8a2.0112140757.168a3a0b@posting.google.com>
Source record: 48081

There has been quite a thread going on Amateur Radar.

I thought I would give some info on one way to do it that would work on any band where FM is allowed (so long as you ID properly).

You FM the transmitter with a sawtooth wave that looks like:

/|/|/|/|/|

...and then mix the same signal with the receive signal.

One method would be to generate the FM signal at an IF frequency and then mix up to the final RF. Use the same IF frequency in the receiver and mix the receive IF with the transmit IF to get a baseband signal.

Digitize the baseband and run an FFT on it. In the FFT spectrum there will be spikes corresponding to the distance to all the targets.

The neat thing about this is that it could be done on 10 GHz with Gunnplexors, where pulse is not allowed. A Gunnplexor, remember, already uses the transmit signal as the receiver oscillator.

I have, of course, left out a lot of details, but I know this will work. The company I work for (www.aeroflexlintek.com) was building such a thing, but the project was canned. I don't know why because Radar is in a different department.

> for adjusting a quad. detector coil?

I know when I worked in two-way, lots of radios used this type of FM detector. I spent a fair amount of time testing out ideas to get better performance from the discriminator, but always found that the 'best' (not so good but as good as it would get) technique was to be sure the 1st & 2nd oscillators were dead on freq, sweep the IF strip to insure proper bandpass characteristics, and then connect a full quieting RF signal with about 60% system deviation at 1KHz. Then adjust quad coil for max AF output from the detector consistent with a good sine wave.

I found that probing the quadrature circuit at the IF freq upset the tuning of the coil even with a good quality 10X probe. This type of FM detector is not known for it's linearity. Perhaps you might consider building a Foster-Sealy discriminator and picking off an IF signal ahead of the quad detector? A properly adjusted FS can give bee-uuu-tea-ful audio.

One other thought.....where are you taking the recovered audio from? If you are in the audio chain somewhere, you may be dealing with a de-emphasis network that your satellite decoder circuitry may not like. Just a thought.....

Source record: 48082

Hello OM's.

I'm currently in the middle of building an antenna tuner, off a basic "L" network design, but I'm having some trouble with the inductor. What I've done is wound a coil out of aluminum electric fence wire (it's cheap, and I use the stuff for dipoles, etc, from time to time). The problem I'm having is that I can't seem to find anyplace to tap it where the capacitor can flatten out the match for any band, 160 to 6.

Is there an optimum spacing of the turns in the coil? Has anyone built a tuner of this sort who might have some advice for a new "Extra Light"? I've only been a HAM for 7 months, and I've still got alot of questions.

Thanks in advance.

You can try this one at your own risk.

Random notes:
My BC700A scanner went hinky; wouldn't stop on live channels when scanning.
The radio seems to use the demodulator, but not the squelch, of the 3359
chip. Looking at the 3359 schematic suggests that the discriminator output
pin should be near 1/2 Vcc.

What I did:
Adjusting the discriminator coil so that the superimposed DC voltage of
the discriminator output was 1/2 Vcc made scan work. Further checking
showed the range of the discriminator output does not go to the Vcc rail;
with 10V Vcc on pin 4, noise peaks were only 8V and flat-topping there.
Noise went all the way to zero, though. So I readjusted the output to
have 4V DC superimposed on the signal, and the radio is MUCH better.

Note the 4V was determined by looking at peak-to-peak noise at the output,
which clipped at 0V and 8V; I took the midpoint.

Hello,

I just wanted to thank everyone for their insight. Don't tell anyone, but I posted this to sci.electronics.basics and got nada; so, thanks guys! =)

I've discovered this 1/2Vcc method myself and it seems foolproof. I've tried everything with the coil and my satellite images still look quite pitiful. This leads me to believe something else is wrong. For kicks, I scoped pin 18 (IF Input) of the 3359 and got a sad looking sine (uneven, clipping in some parts). Of course, this is after Ramsey's "IF Amp."

So, next question, am I right in assuming that the signal from the 10.7Mhz ceramic filter should be a fairly clean sine? Also, Ramsey did an apparent no-no on the L.O. design. According to the SA(NE)602 datasheet, there shouldn't be a resistance smaller than 22k from pin 7 to GND. Ramsey has 10k - so I swapped it out. I guess I should take this to sci.electronics.repair as I'm at a loss as to what could be wrong.

NOT true; MY transceiver just might (it doesn't, but it MIGHT) shift 20KHz
from receive to transmit mode. Just because I tune MY receiver to zero-
beat YOUR signal does NOT mean that MY transmitted signal will be within
YOUR receiver's passband.

I think you are making the mistake of assuming that everyone on the
"other" end has a radio that is exactly (or even almost) like yours.
That is not necessarily true.

>Which way you choose is only interesting for yourself. I made some
>extensive tests to check that when I tune a signal through my cw
>filter + DSP-9 it is exactly zero beat for the opposite station

Instead of telling us how extensive your tests were, think a minute:

since YOU do NOT know what the SETUP is at the OTHER end,
and
since YOU can NOT control what HAPPENS on the OTHER end,
then
NOTHING YOU do can guarantee zero beat (exact or otherwise) on either end!

Chris:

An L network is an effective circuit. I have used one myself for over 20 years, based on a DJ2LR design that appeared in QST around 1974.

I assume you have the inductance in between the input and output terminals and the capacitance from one end of the coil to ground. The tuner port next to the capacitor has to be the higher impedance end. If the other tuner port is transmitter side, with 50 ohms going in, you must have more than 50 ohms on the tuner port next to capacitor. If the antenna/feedline actually presents a lower than 50 ohm impedance, then you will need to reverse the tuner so the capacitor is on the imput side.

If you are unable to obtain a match with any coil/capacitor settings, try reversing the tuner and try again.

Not pin 8, that's from the limiter output so that it will be constant
amplitude noise. Look at one of the demod outputs, pin 10 (I think,
but it's been a while), and you'll see, with no input, noise that is
getting clipped on either top or the bottom of the waveform. Adjust the
quad coil halfway between the two points where each happens.

Bullshit, this is a technical newsgroup so I believe some technical
details may be understood......(?).
Many years ago one had to listen over the band after a CQ call because
not everybody had the same xtals as you, I must admit that such
operational practice is not particular effective when operating
contests, not even on VHF, so often one didn't make too many QSO's!

It is all a question of understanding what it means to tune to ZERO
BEAT. I've never had any problem to do this, and I have had many
different rigs, but maybe not any junk would perform satisfactorily.
What it means to tune to ZERO BEAT has been repetitively mentioned in
QST and ARRL handbooks for the last 80 years or so, so I won't mention
how to do it here.

For many years I used the combination Drake 2-B with FL-dx-500, the
receiver was later Drake R-4C, and the transmitter was later FT-101B
(I didn't use the receiver much as it is garbage) - still operated
SEPARATE RX and TX. Then I used FT-7 for some years, and then FT-902
for the last 13 years. Also used Heath-Kit SB-300 with Starflite 390
TX in the 60's, but Drake 2-B was found to be extremely much better.

I checked the circuit diagrams for the transceivers to verify that
they would transmit ZERO-BEAT when they are tuned to the suitable

pitch, and discovered that it was an advantage to change the CW-carrier frequency xtal for FT-7 and modify the RX so CW was operated as USB on most bands, because you often listen in SSB mode and then wish to transmit, and most part of my operation is CW/SSB on VHF/UHF.

FT-902 has 20 modifications to update it to a useful state, one such modification is to allow the ssb filter to be used for CW operation, but of course - in HF contests 0.5kHz or lower selectivity should be used, the DSP-9 is well suited for this purpose

Another important point to bear in mind is that it is very crowded on many bands, so if you are not exactly zero beat, you occupy more spectrum than neccessary, and you should ALWAYS listen on the frequency you transmit to verify that it is not occupied by somebody else, you may have to wait if somebody has occupied your frequency which wasn't in use when you listened to the opposite station, such ends up with quite IMPRACTCAL way of operation

7695. Re: Antenna Tuner Project

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-15 05:06:38 UTC
From: Sideband <sideband@spam.me.not>
Message-ID: <3C1ADA6E.A177345D@spam.me.not>
Source record: 48091

Roughly 2 1/2 inches, and 25 turns on the coil, 14 ga aluminum solid wire.

I've tried one wire width to about 5 wire widths spacing, to no avail.

Trying to tune a G5RV for 80-6, but 160-6 would be nice. I'm only running
100 watts.

The cap is out of an old Kenwood stereo receiver. I haven't seen any arcing
(yet), but then again, I've only put 30 watts through it so far.

"L" because it's simple, and I haven't been able to find any schematics for
a pi network or the like, and I only have/can afford the one capacitor.

I don't have anything with "ARRL" on it. There are many reasons for that,
the first and foremost being that I don't have alot of money to spare.

Hope that helps to fill in the holes.

Hrm. Never thought of that. Thanks Roger, I'll give that a shot and see
what happens.

There are actually *eight* different configurations of L-networks, and
none of them can match all possible impedances. Maybe you're trying to
match an impedance that is impossible for the configuration you are
using.

Also you need to be aware that a perfect match can only be obtained with
one specific value of L and one specific value of C. Even if you are
using the correct network, with a tapped L the optimum value may be
between two tap positions.

The two most common L-networks are:
A: 50 ohm input - series L - parallel c - output
B: 50 ohm input - parallel C - series L - output
(Actually the right L-network will match any impedance to any other, but
for this application the input is always 50 ohms.)

Network A gives an impedance step-up from 50 ohms, and network B gives a
step-down. To change from one to the other, simply swap the input and
output.

Between these two networks, there is no impedance that cannot be
matched... except, ironically, impedances very close to 50 ohms. To
match 50 ohms to exactly 50 ohms you would have to make both L and C
zero - in other words, remove the network. Likewise the L and C values
needed to match impedances close to 50 ohms may become unworkable (like
C less than the minimum value of your variable capacitor).

I guess the core reference to this topic is 'Antenna Impedance Matching'
by W N Caron, published by ARRL, though I haven't read that, and it may
tell you more than you need to know right now! However, ARRL have a
number of other titles that don't go into as much detail, but also cover
a wider range of topics you're soon going to find useful. These include

the 'ARRL Antenna Book', 'Antennas and Techniques for Low-Band DXing' (because that does give a good summary about L-networks, quoting from Caron) and of course the 'ARRL Handbook'. All these titles can be ordered from www.arrl.org.

Later: noted your comment about not having much money to spare, eg for books. But look at where you are right now: you have a rig, you have some wire, and you have some components. Now is the time to invest a few $$ in the knowledge you need to make it all work.

I strongly recommend that you buy at least the ARRL Handbook - and now is a good time to get the 2000 edition at a discounted price. Or if you are more interested in antennas right now, the Antenna Book contains vastly more information than the single chapter in the main Handbook... it's the usual balance between breadth and depth of coverage.

Seriously - I mean it. From where you are now, it's the right next move. Get some good books and get your head into them!

The assumption that replying at zero beat is
highly desirable is incorrect. Good and
competitive CW operators know that calling as much
as 200 Hz off frequency is usually much more
productive in pileup situations. The XIT control
is useful for this. A disadvantage of razor-thin
filter selectivity is that this very useful
strategy does not work well. A good operator uses
his "ear" as an adaptive filter and lets the
receiver cover a few hundred HZ.

Ian:

Thanks for the input here.

Hrm. I was hoping a simple L network would be able to do what I need it to do, but it's not looking that way.

What other low cost options are there? I can't afford to be dropping a couple hundred dollars (US) on capacitors anytime soon... and to be honest, of I had $250 to drop, I'd buy that nice LDG autotuner with the IC-706 interface cable to go with my rig (which is mostly why I'm broke to begin with. Still paying that one off). and be done with it. One of the local HAMs was nice enough to loan me his MFJ tuner for the time being, until I can brew up/buy/get from Santa Claus one of my own, so I'm able to play on HF, but I'd like to get his equipment back to him as soon as I can. I'm not planning on running any more than the 100 watts I have for now... eventually I hope to have something nice and large to put behind the radio, but that's going to be a few years off.

Thanks again, and 73 de AB8LR, Chris

200Hz offset shouldn't cause any problem when I use a 500kHz cw filter
for my receiver when calling CQ, but I don't useually expects
pile-ups, such happens more on ssb, and also on aurora, but the
problem with aurora is that a cw signal sounds more like switched
white noise, two signals or more will mask each other even if they are
not on same frequency

The greater versatility of the T-network is why it is used in most factory-made tuners. For now, I suggest you open up your friend's MFJ tuner and clone it as closely as you can!

The main problem will be to find *two* capacitors with wide enough spacing to handle 100W in all applications... but the bargains are out there, if you can find them.

Don't buy the auto-tuner - on your budget, that's a luxury item. You won't learn anything from it, so it will only make you poor and ignorant. (Bah humbug, I'm beginning to sound like Reg!)

Ian:

ROFL! Would that be so bad to sound like Reg? From what I've read from him, he's a pretty smart guy.

Even if I get the autotuner, I'm still going to build one... It's just a matter of how, when, and how much.

At least I'm getting the right ideas now... an "L" just isn't going to do it, unless I can reverse the "L", and that's not likely to be convenient.

Time to rethink (but not drop) the whole thing.

Thanks for the comments.

7704. Shielding Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-15 20:23:05 UTC
From: Jim Hill <Xslimjimzz@home.com>
Message-ID: <04cn1ugnvibm3cgd8vqvc3guljih56mufo@4ax.com>
Source record: 48001

I built a crystal set with a large coil, and discovered the coil acted as a loop antenna and picked up a few local stations. 50 kW KNX 1070, a few miles from my house, was so strong it could not be nulled out by rotating the set.

I built a shielded enclosure by taping aluminum foil to a large cardboard box that held a TV set, but there no attenuation.

There were a few holes in the foil, but I decided to experiment with a smaller radio without earphone leads, and turned used an old transistorized AM radio. I tried a metal cookie can, and any attenuation seemed to be from the audio signal going through the can. While the lid was not RF-tight, it did have about a ï¿½' overlap.

I have an old Heath TX-1 transmitter (an updated DX-100) that is shielded for TVI avoidance. For example, the meter and frequency dial are enclosed in metal containers. There's an access port at the top, and I used it to put the radio inside. There are plenty of 1/16" ventilation holes, so no audio attenuation - or any decrease in audio level. Surface between the access port door and case is painted and no finger stock, but presumably the case provides attenuation at TV frequencies. Otherwise there would be no reason to go to the trouble of shielding the meter and dial.

I also tried some commercial metal file cabinets. There was no attenuation.

Further tests would require fabricating metal test boxes using my small stock of expensive sheet aluminum or galvanized iron sheet. I've decided the magnetic field is harder to shield the electric field, and need some advice before proceeding.

Does anyone have experience in this field? Is aluminum ok? Is thicker wall sheet needed? Is galvanized iron the way to go? If so, I'll need a larger enclosure to avoid lower Q problems. Is double shielding required? Much more work is involved, if so.
Thanks

7705. Re: Shielding Question

Newsgroup: rec.radio.amateur.homebrew

Source record: 48002

If you are looking for magnetic shielding, you need a ferris metal.
This usually means some kind of steel. Simply test any potential metal
with a magnet. If the magnet is attracted, you can give it a try.
Aluminum will not work.

We have a metal scrap yard here in Phoenix (Davis Metal) that sells
scrap sheets of metal cheap. The only way I could tell some grades of
aluminum (there are many) from steel was by using the magnet test.

If you want really, really good magnetic field shielding, mu metal can
be used, but it is a speciality metal and is thus very expensive.

Currently for sale are 2 Micor T73RTN-3400A Radios.These radios look complete but they are untested and sold AS IS.I would be happy to email photos if interested.I am asking $50 each plus actual shipping charges.I also have a large quantity of Micors and a few Mitreks plus components such as wiring harnesses,speakers,control heads and antennas.I will accept offers on the whole lot.
Thank You

No, I guess that in a filter with a passband 500,000 Hz wide,
you won't have much trouble letting a signal through that's
only 200 Hz off. That's also true for a filter with a 500 Hz
passband, which I think is what you meant.

Thanks for the thread, everyone. I'm learning stuff I need to
know for when I get my ticket back -- 41 years after I let it
lapse. At least I don't have to take the code exam again. ;=)

Any xtal receiver set, WILL receive the strongest station only. There is absolutely NO selectivity in a Xtal set.
You will have to build a "super-het" to do what you say you want. A tunable bandpass circuit might help on the xtal set, but not likely.

Rubbish. A friend of mine in suburban LA has logged a couple dozen
stations on his crystal set, as far away as St. George, Utah and San
Francisco. He is using a double-tuned 'front-end'.

Aluminum shielding should be fine and the thickness should not make a significant difference. Remember however that in addition to shielding you have to prevent the RF from entering the enclosure via some other means. If you do not bypass the headset leads, for example, then the RF will just follow the leads into the box. If you are trying to eliminate interferrence from a strong station on the broadcast band while picking up a weak signal in the same band, you will also need a very sharp filter on the antenna input. Otherwise your antenna will simply feed the undesired signal into the box. What you might do here is to use a series resonant circuit (tuned to the undesired station) between the antenna and ground (the box). The series resonant circuit will be a "short circuit" to the undesired signal and an "open circuit" to all other frequencies. The more widely separated the two stations are in frequency, the better this works.

> There is absolutely NO selectivity in a Xtal set.

Well, most of the "simple" xtal sets we are familiar with have a tuned
circuit that is not very selective. It's not really related to the
fact that it is a xtal set - its related to the simple circuit used.
It should be quite possible to build a multiple stage tuned circuit
that would provide much better selectivity for the crystal detector.

200Hz offset shouldn't cause any problem when I use a 500kHz cw filter
in a contest, but I don't usually expects pile-ups

The tactic you mention is not particularly useful in contests when the
band is crowded, but whatever you do, it is important to know what you
do, you must hit the frequency you intend to, if you moved the
opposite way would be bad tactic. My first intention was to make a
tool to simplify correct tuning whatever the tactic is

It is a very good idea to check http://www.g4fgq.com and try the
program endfeed.exe, the program shows different L-C combinations
needed to transform to 50 ohm. Try different antenna lengths and see
how the component values varies
I have have pasted the different results to word and printed for some
local discussions and got good response from several local hams during
the last week

Here's some information about shielding, but I don't think that even a perfect shield will solve your problem.

Like quite a few other things, effective shielding isn't nearly as easy as it might seem. People often look in the wrong place for the problem when shielding isn't effective, and a common place they look is the material being used. It doesn't matter how good you make the shield itself, if energy can get through or around it. And that's usually the problem when done by people who aren't very well acquainted with proper shielding techniques. If you want to make an effective shield, you have to prevent RF from getting through it on any of the wires going in or out. This includes power and headphone leads. These wires act like antennas outside the box, then the signals they pick up follow the wires in. Very careful bypassing directly to the shield right at the entry points with physically small capacitors having very short leads is one technique. Feedthrough capacitors are better. Common mode chokes made by winding the leads on a high-permeability ferrite core at the point of entry can also help a lot, and even more when combined with bypass capacitors. Even small gaps in a shield can let in many, many times more energy than can get through the shield metal itself, so sealing has to be good.

Shields keep fields out by two methods, reflection and absorption. The reflective loss is independent of material thickness provided the material is at least a few skin depths thick, but varies with frequency and material type. At 1 MHz, the reflection loss of an aluminum shield is about 105 dB. Copper is only very slightly better. You'd need an aluminum or copper thickness of around 15-20 mils (.015 - .020") to meet the requirement of being several skin depths thick in the broadcast band. Absorption loss does vary with thickness, and would be around 40 dB for 15 mil aluminum. You'd have to work really hard on gaps and on wires penetrating the shield to avoid having them being the dominant source of leakage. If you hook up an external antenna, there'll undoubtedly be way more signal coming in on it than will be coming through the shield.

In your case, you could test the effectiveness of the shield by disconnecting any external antenna, then working on the shielding until the interfering signal is gone. I assure you it's entirely possible to do, although it might take a while. But I assume you're wanting to use an external antenna, and this will unavoidably let the interfering signal into the enclosure. The tuned circuit you have is unavoidably pretty nonselective, and the crystal will happily rectify whatever it gets. So my guess is that you won't be able to get rid of the interfering station no matter how good a shield you make -- it'll simply

come in on the antenna with the desired signals, get through or around the tuned circuit, and be demodulated. If I'm right, the only thing you can do is to make a higher Q front end, which probably means multiple tuned circuits and additional loss, and then an amplifier to make up for the loss. In short, I think you're pretty much stuck with listening to the one strong station with your crystal set.

Program DIPOLE2 will calculate L and C values of an L-tuner for any dipole at any height with any transmission line, coax or balanced-twin or both, of any length.

Program ENDFEED will calculate L and C values of a T-tuner or L-tuner for almost any vertical or inverted inverted L over a ground system.

Just enter all dimensions then What-if?

Both programs also estimate radiating efficiency.

Program SOLNOID2 will tell you number of turns to wind on a coil former of given length and diameter.

Download in a few seconds from website below. Not zipped-up. Run immediately.

What a pity they take all the fun out of stuimbling about in the dark.

You also have to shield the bottom. In other words, the shield has to totally enclose the receiver. Further, the shield needs to be grounded! The best idea would be a metal box like a rack cabinet, depending on how big the unit is. Then you ground the case and bypass all leads entering, except of course the antenna lead.

But if you have a powerful local station like that, you may have to add a trap in the antenna lead. This is a filter, like a tuned circuit, tuned to 1070 kHz that attenuates that frequency. The simplest would be a series tuned circuit between antenna and ground, or a parallel tuned circuit in series with the antenna lead. If you make it adjustable you can tune it precisely for minimum interference, and if you want to listen to 1070 you just detune it. (That frequency has good old time radio every evening so you can really pretend you are living in the 1940s or so!)

Hello to all !!!
I building a 160m (1750 - 1850 Khz) AM/CW transmitter. I use the 6AG7 as colpitts oscilator, the 6L6 as buffer and two 807 in parallel
in class C at the final stage running at 600 VDC. I need data for the output pi-network (or thomson network) for 50 ohm unbalanced out.
After this I would use a 4:1 balanced to unbalanced ballun to feed an open wire feed line to a dipole.
I need also the output circuit data to feed directly the open wire feed line without the use of the ballun.

Hi,
Can anyone recommend a DPDT 12vdc coil antenna change over relay for a 600 watt amp I am building. Coaxial relays are a bit expensive. I have a fair selection of Potter, Struthers-Dunn ect. with 12vdc coils and ample voltage/current ratings, but I am sure there is more to it for rf service. Got any tests to see if a particular relay can be used? Got mfj-259b, scope, Z meter, vom, power supplies ect. The references I have consulted don't seem to address relay selection very well. Thanks

hi gary all i have ever used were dpdt relays with contacts rated for
10-15 amps i use these everyday for phased arrays and they handle legal
limit no problem. you may have some vswr problems at the higher freqs in
that case go with a 4pdt relay and short all common side contacts
together to bring the z bump down.

Nonsense. My crystal set will resolve DX stations 30kHz from a
local 50kW powerhouse on 1080kHz, and it isn't close to some
of the more competitive designs currently in use.

Serious crystal sets have up to three variably coupled tuned circuits,
notch filter tuning, properly matched sound-powered headphones,
etc. to log rather amazing DX work. Too many people judge crystal
radios by what RadioShack stocks.

Interesting. Must be a hole or a wire coming out?

I have demonstrated shielding for years by placing a wide band noise source in a coffee can and covering it with aluminum foil. Works perfectly. No detectable signal gets out so therfore no detectable signal gets in. Without the cover noise is present above but not in any other direction - at least in the near field.

7732. Watch Crystal Adjustment

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-16 19:03:53 UTC
From: "Clyde R. Shappee" <cshappee@ieee.org>
Message-ID: <3C1CF018.78868ED7@ieee.org>
Source record: 48028

This may be little off topic, but this group is a likely place to find a reader who knows how to adjust a quartz watch.

This is what I tried, not knowing how jewelers do it, when asked.

I wound a coil on a 2 inch form with all the #30 wire I had to about 2 inches in length and it measured .94 mH. I tuned it to 32768 kHz with 0.25 uF, making a parallel circuit. I amplified the signal across it quite a bit and hooked it up to the scope.

I put a watch with a second hand in the coil and what I saw was once per second a burst of 32 kHz energy. Not what I expected. I expected to pick up a continuous signal.

I have a watch with an LCD and saw nothing.

Any thoughts you may share?

On Sat, 15 Dec 2001 16:07:55 -0800, Roy Lewallen <w7el@eznec.com> wrote:

|Here's some information about shielding, but I don't think that even a
|perfect shield will solve your problem.
|
|Like quite a few other things, effective shielding isn't nearly as easy
|as it might seem. People often look in the wrong place for the problem
|when shielding isn't effective, and a common place they look is the
|material being used. It doesn't matter how good you make the shield
|itself, if energy can get through or around it. And that's usually the
|problem when done by people who aren't very well acquainted with proper
|shielding techniques. If you want to make an effective shield, you have
|to prevent RF from getting through it on any of the wires going in or
|out. This includes power and headphone leads. These wires act like
|antennas outside the box, then the signals they pick up follow the wires
|in. Very careful bypassing directly to the shield right at the entry
|points with physically small capacitors having very short leads is one
|technique. Feedthrough capacitors are better. Common mode chokes made by
|winding the leads on a high-permeability ferrite core at the point of
|entry can also help a lot, and even more when combined with bypass
|capacitors. Even small gaps in a shield can let in many, many times more
|energy than can get through the shield metal itself, so sealing has to
|be good.
|
|Shields keep fields out by two methods, reflection and absorption. The
|reflective loss is independent of material thickness provided the
|material is at least a few skin depths thick, but varies with frequency
|and material type. At 1 MHz, the reflection loss of an aluminum shield
|is about 105 dB. Copper is only very slightly better. You'd need an
|aluminum or copper thickness of around 15-20 mils (.015 - .020") to meet
|the requirement of being several skin depths thick in the broadcast
|band. Absorption loss does vary with thickness, and would be around 40
|dB for 15 mil aluminum. You'd have to work really hard on gaps and on
|wires penetrating the shield to avoid having them being the dominant
|source of leakage. If you hook up an external antenna, there'll
|undoubtedly be way more signal coming in on it than will be coming
|through the shield.
|
|In your case, you could test the effectiveness of the shield by
|disconnecting any external antenna, then working on the shielding until
|the interfering signal is gone. I assure you it's entirely possible to
|do, although it might take a while. But I assume you're wanting to use
|an external antenna, and this will unavoidably let the interfering
|signal into the enclosure. The tuned circuit you have is unavoidably

|pretty nonselective, and the crystal will happily rectify whatever it
|gets. So my guess is that you won't be able to get rid of the
|interfering station no matter how good a shield you make -- it'll simply
|come in on the antenna with the desired signals, get through or around
|the tuned circuit, and be demodulated. If I'm right, the only thing you
|can do is to make a higher Q front end, which probably means multiple
|tuned circuits and additional loss, and then an amplifier to make up for
|the loss. In short, I think you're pretty much stuck with listening to
|the one strong station with your crystal set.

I second everything Roy says. I have in my previous career specified and purchased a couple of shielded rooms. I can attest to the fact that achieving high levels of attenuation is not a trivial exercise.

And of course in this case, as Roy has already pointed out, the problem is exacerbated by the fact that if you want to listen to any stations, you must connect an antenna, which means all efforts at shielding are pretty much for naught. Penetrations into the shielded volume are some of most difficult factors to deal with in maintaining high degrees of attenuation.

One thought would be to forget trying to shield the inductor and use multiple tuned circuits and go to toroidial construction for the inductors.

Yeah, you are seeing the pulse of energy that moves the hands. There is a little motor or solenoid in there. The LCD watch has no moving parts and thus no motors. The batteries will last longer in the LCD watch for that reason.

>Is that thought in the right ballpark?

Yes.

Assume operating around 10 GHz, the wavelength is 3 cm. If an object moves towards you at 30 m/s (108 km/h, 67mps), the two-way doppler will be 2 kHz.

However, if the object is stationary at a distance of 300m, thus the round trip time will be 2 us and the transmitter frequency is varied by 100 MHz/s, the received frequency will differ by 200 Hz from the current Tx frequency.

If the object is moving towards you at 30 m/s at a distance of 300 m, when scanning upwards, the frequency difference is 1800 Hz (2000 - 200) and when scanning downwards 2200Hz (2000+200). From these figures it easy to calculate both the speed and distance. Use the Tx as the local oscillator for the receiver to avoid any frequency tracking problems.

Try using a microphone instead.

I've used piezo elements physically coupled to the watch with a short piece of paperclip soldered directly to the element face (be careful not to overheat the piezo pellet).

That doesn't work too well for mechanical watches, the tick saturates the amplifier, but in between you can see the 32 kHz oscillations. The actual crystal is normally a tiny silicon tuning fork.

If you are really careful you can unsolder the can without destroying it, I did it accidently once to a 38 kHz version, and inspect it. With a strobe light (LED + 555) and a magnifier you can actually see it moving.

If the 10 volts is not too critical an old junked tube radio power
transformer will give you 6.3 and 5 volt windings which if connected in
series will provide 11.3 volts at several amps. (especially if there is
now no load on the B+ winding). 11.3 x 3 amps = 30+ watts.
If it is only a small load of say half an amp or less a regular wall
wart or maybe an old toy train set or front door bell transformer may do
the trick!
Could depend what you need the ten volts for?
Couple of ideas.

Watch 'crystal' used to mean the glass face of the watch! These days it refers to the timing element of electronic watches!
However and with apologies for being further off topic can anybody suggest a news group or where to look for a 'non-electric' no batteries needed, wrist watch. i.e. One that you mechanically wind up periodically.
So far the only one I have a lead on is $125 plus tax and shipping and possibly import duty; I am not in that price league! More of a Timex or Cardinal candidate!
TIA

Terry,

Actually, I have a really cool wind up watch, being a time freak.

I decided that lots of folks have Swiss army watches, and, being a patriot, I looked for a US Army watch.

I found one, with what is called a "hack stop", so you may synchronize the seconds. I'll poke around on the web and try to find a source. It is manufactured by Stocker and Yale in New Hampster. It keeps acceptable time, and (sigh) has a Swiss Movement, 23 jewels if I recall.

My other wind up watch was given to me on my 12th birthday, many years ago and I wear it sometimes when I want a trip back in time and remember a simpler time.

Kindest regards,

Clyde

Rolex Submariner. It's a certified chronometer, it "hacks" and it's
waterproof to 300M. It gains about .75 to 1 second per day (I know,
it's a chronometer and I have it logged against WWV. Unlike a
chronometer, I set it twice a year, I don't like remembering if it's
UTC -4 or UTC -5.) I haven't been able to even scratch the crystal.
The downside...4 kilodollars and it goes in for service every 5 years
for about $500 worth.

You're a lucky man if your Sub is that accurate. I've owned 3 over the years, as well as a few other models and about 5-6 seconds per day is more typical.

I have a GMT Master II that is also a 5-6 seconds per day watch. This is still WELL below the standards required for COSC chronograph rating- they aren't that stringent. It doesn't have to be very accurate to be able to find continental land masses by celestial navigation, which is what COSC certification refers to.

I have a Bell and Ross Space One that is within a second a day, and a 60's model Wakmann Breitling that is as well, but I've never seen a Rolex that was that tight. I have a couple other Swiss watches that run about 3 seconds per day.

Hang on to it!

I just got off the phone with my father, and he at one point in his career dealt with the guy who invented the crystal cut for the 32,768 kHz crystal.

According to my father, (information now second hand), this person stated that quartz watches are not adjustable. You get what you get, and that they were pretty good. Hmmm. I wonder about my new Swiss watch.

My wife who is ABSOLUTELY not ruled by time at all has a Pulsar, and when I go and adjust it for Daylight Savings Time, it is right on. None of my watches are so good. No justice.

In that case I have to wonder why I was able to listen to a variety of
stations with the set I built as a boy. I think I would agree that the
selectivity was poor, but there IS a tuned circuit, which is tunable.
At least mine had one.

7748. Homebrew AM Transmitter/Transceiver Suggestions

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-17 02:44:49 UTC
From: jcplpsm@aol.communicate
Message-ID: <20011216214449.09259.00000609@mb-fd.aol.com>
Source record: 48044

Happy holidays all,

I am contemplating building an HF AM transmitter or transceiver soon and I am looking for suggested plans and/or schematics. I would like the rig to operate on both 40 and 80 meters, but would consider a monobander. Something in the 300 to 500 watt range would be fine, preferably using sweep tubes. This isn't necessary, though.

Anybody have a favorite project that they have built along these lines? Any suggestions or references would be appreciated. I don't want to purchase a prebuilt rig, I want to build it myself.

Thanks,
Scott M.

Hi Scott,
I don't think you'll find yourself in the multi-hundred watt range on AM
with sweep tubes. I just browsed thru a few old ARRL Handbooks from the
50s and early 60s and 813s seem to be a favorite. Thats good because
they are cheap! 4-400s would be nice too. The modulator info gets much
better in the 60s editions, btw.
I seem to recall a very nice multi-band tranmitter in the '64 Edition
which I no longer have...its not in the '65.
Typically what I'm seeing in these old transmitter designs is the basic
VFO multiplying technique to get to the band you want. That won't lend
itself to a transceiver design.
Are you wanting to build all with tubes (except maybe the VFO)? I've
got quite a few bookmarks and will help do some browsing just out of
curiosity.
-Bill

Bill (and Scott);

That transmitter in the 64 book is CW and SSB only as shown, although the book makes a brief mention of it being 'capable of plate modulation being applied to the RF amplifier in the usual manner', its output is derated to 250 W under that mode.

Scott, if you want copies of the relevant pages of the book, e-mail me and I'll get them to you.

regards,

G

> Any thoughts you may share?

If you have a burst at 1/second, use it to trigger a timer
with a time long enough to end up with a once per second
simple pulse. Feed that into a flipflop to get a positive gate
signal of 1 second, and use that to gate a high frequency signal
into a counter. Most counters will accept an external gate for
their reference frequencies. Then you can adjust the watch.
For example, if the counter ref freq is 10 mhz, just adjust the
watch until you get exactly 10 million pulses in the gate time.

You didn't indicate what frequency range you are using. For HF work, most any relay will do the job but if you are including 10 meters it's wise to choose a relay with low loss insulation. Use a relay with larger than necessary contacts because there will be carbon build after a while and you don't want the contacts eroding and causing intermittent high SWR.

For higher frequency work, you will need something with small dimensions yet fat contacts. That's why a coaxial relay is the best choice.

Attention all "natural radio" VLF listeners,

This is to announce the startup of an e-mail based "natural radio" VLF discussion group. This group contains members from all walks of life who are interested in discussing "natural radio" and related topics to "natural radio" VLF monitoring. VLF listeners now have an outlet for discussing "natural radio" related issues and similar topics in a group format. Current VLF activity, whistlers, chorus, schematics, receiver designs, etc., are all welcome.

If you are interested in becoming a member of the "natural radio" VLF discussion group, contact me directly by sending an e-mail to Korgans@yahoo.com.

You have gone to some trouble to achieve a loosely coupled pickup, but
it's an inductive one which will see what you saw - the energy puls
into the stepper/solenoid.

I use a spectrum analyser and sniffer for this type of work (doesn't
help the 99.9% of hams who don't have one though). Most jewellers
(sic) use a probe connected to an instrument which reads out directly
in units fast/slow compared to the inbuilt reference. Dunno if the
units are secs/day, ppm or what.

The thing to note is the relative impracticality of setting such a low
frequency reference directly. One second per day is 12 ppm, which is
a cycle of the 32k every 2.7 secs. Unless you have a very precise
local 32k reference, this isn't all that easy.

He is probably seeing his tank circuit ringing down after being
energised by the tick transient. So all he will see is how accurate his
coil + cap is. It is all pretty academic, because I've never seen a
crystal watch with a trimmer capacitor.

Also, have you ever tried to trim a low frequency oscillator? The
count times are so damn long it just isn't practical.

Looks like you've gotten some good advice. I'll add that the 32 kHz energy is your tuned pickup ringing in response to the pulse it's responding to, and has nothing to do with the oscillator frequency. I'll bet that you can make the ring frequency whatever you want by tuning the pickup. The suggestion of using the one second pulse period to set a counter gate time seems like a good one to me. The oscillator power has to be extremely low, or the watch battery wouldn't last long. The pulse to the stepping motor, on the other hand, would involve a lot more current, which is why you're seeing it and not the oscillator.

FS; DB Products Corp., VHF duplexer model DB-4062 (a bank of 6 cavities). Duplexer is in its own original steel cabinet and ready to go. It is currently on 153/154 mhz so will need to be retuned for 2 meter use. $425.

Huh? I could have sworn that I saw a trimmer cap in my watch last time I replaced the batteries.

How do they "calibrate" the things for timekeeping? Surely those 25-cent crystals aren't accurate enough on their own!

None of the $2 store ones I've ever opened and fiddled with have. All they have is a board with an embeded chip in some black epoxy, 2 chip caps, a battery, button contacts, a crystal, and the LCD assembly, some have a piezo and/or a grain of wheat globe depending on their features.

The Swatch style electromechanical devices have even less, just a big electromagnet, the mechanics, a battery, crystal, and a some chip in there too.

Maybe the more fancy ones have trimmers? Can't be too easy to calibrate though, they'd have to be a body temp, and jitter could be a problem with a gated pulse counting system.

It would be close enough, they aren't exactly a hydrogen maser.

>The greater versatility of the T-network is why it is used in most
>factory-made tuners. For now, I suggest you open up your friend's MFJ
>tuner and clone it as closely as you can!

NO! If it's like the one I opened (and then immediately returned), it's a
HIGH-PASS network and not a LOW-PASS, which you may want (need?-):

```
---C---+---C--- ---LLLLLLLLL---
| >>>>>>>>> ^ <<<<< Alligator clip tap!
in L out |
| C
-------+------- -------+--------
```

ONE inductor, ONE capacitor, and TWO alligator clips (good quality--but
that's another story) make the most versatile tuner possible at VERY LOW
cost. It does look a little home-brew, but IMHO that ADDs to its value!

You didn't read my suggestion closely enough. The idea is to get a
1-second pulse and exclude the 32.768 khz part.

> It is all pretty academic, because I've never seen a
> crystal watch with a trimmer capacitor.

The Casio watch I had before I lost it had a trimmer. I haven't opened
the Timex I'm wearing yet because it's been pretty accurate.

> Also, have you ever tried to trim a low frequency oscillator? The
> count times are so damn long it just isn't practical.

That's where using an hf oscillator (such as the frequency counter's
precision clock) gated by the 1 second pulse comes in. You use period
measurement rather than frequency measurement. Using a 10 mhz
oscillator, you can adjust to within +/- 1 part in 10^7, plus or minus
one count, plus or minus the inaccuracy of the oscillator. There being
about 30 million seconds in a year, you could get as close as, say, five
seconds per year, disregarding thermal drift.

To take the topic even further afield, how about this for a consumer
product:
There are cheap receivers that get wwv and display it digitally. What if
someone builds one into a little stand that we set our watches on at
night, that magnetically or optically connect to the watch and correct
it to the exact second.

In the Sydney Observatory there used to be a watch calibrator machine,
it had a chunk of metal with a tiny spring-loaded tranducer pin sticking

out of it, you'd rest to watch on it, back down, touching the pin that stuck out through the top.

It had two modes, mechanical or quartz. I guess it used a similar gated pulse counting technique for the mechanical watches, but it could do LCD ones to, so I assume it could feel the 32kHz oscillator. It had a 10 segment multi-coloured bargraph of LEDs that indicated 'signal', it would either sit at about 7 lights with LCD/quartz watches, or bounce off the scale each second for quartz/mechanicals, pure mechanicals were more complex having a sporadic signal in between pulses per second.

It read out in ppm, seconds per day, and frequency. I remember some readings took a while to light up (like a minute or so). I think it had a rubidium reference. The unit it self was fairly small, about the size of a 3RU case, on a stand off the floor, with some operation instructions in a perspex box behind it. I was pretty young the last time I saw it, so it may not still be there, and details about it are a bit hazy.

I had a quartz mechanical watch that used to confuse it totally, it would say it was loosing then gaining 100s of seconds per day, while in my experence the watch lost only a second or two per week. Other watches were fine, most LCD ones I tried were around 20 ppm IIRC. I used to love playing with it whenever I was there, I totally forgot about it until now!

Can't you buy a wrist watch that syncs to the LW time reference
(forgotten the call sign)? I think I remember reading that on the NIST
website.

I've seen the WWV wall and desk clocks.

I haven't seen one of the LW watches yet. I have a small digital clock
that receives the LW, and I really like it- it's always on the button. I
bought an analog clock at Wal-mart that claimed to be atomic, but I took
it back. It was a quartz movement with an added module that received the
wwv signal, but there was no indication whether it was receiving or
locked, and the instructions said something like 'if the signal is not
received, the clock will work as a regular quartz clock...'. I don't
need another clock around that I might have to set.

7772. Galena Crystal detector construction

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-17 19:40:00 UTC
From: mike coslo <mjc5@psu.edu>
Message-ID: <3C1E4A11.D5C2945A@psu.edu>
Source record: 47969

Hi All

I'm working on a homebrew Galena crystal detector radio, and had a few questions.

What is a historically accurate method of mounting the crystal? I was going to mount the crystal in solder in a steel or copper cup (melt the solder in the cup, and plunk it in the cup.

The other question is on the cats whisker. I was going to make a "pinched ball" arrangement with the whisker on an end. Is this at all accurate?

But of course you wouldn't use that sort of system! With a 100MHz timebase and only pulse counting techniques, you can get one part in 10^8 in a second or so. You just use the 32.768kHz (divided down) to generate the gate, while counting the 100MHz. Obviously you don't need anything that high resolution. That gives you period, and 1/period = frequency. You could also do it (since it's only one frequency you're interested in) with a phase-comparator system which would let you measure, say, phase drift rates of under one degree per second, in a second or so. That's well under one part per million. (We--HP/Agilent at other sites--build some counters that claim to be fast at resolving any input frequency to many digits. But I've found when I want to get the fastest resolution to microhertz of a signal that's a few kHz, the FFT techniques we--at this site--have focussed on.)

Since the tuning-fork crystals have a known temperature characteristic, it wouldn't be too bad to simply calibrate "off" just a bit at room temperature.

I suppose not all watch-repair places have the ability to properly adjust LCD watches (the ones that do have trimmers...and I have seen some that do), but the calibrator equipment wouldn't (shouldn't?) be prohibitively expensive for places that deal in kilodollar watches.

Cheers,
Tom

==========
Nowadays most if not all of the LCD , LW clocks whether operating on MSF
(Rugby-England) , 60 Khz or WWV (60 KHz ??) or DCF - Germany (77 KHz) do
have their own quartz crystal such that in case the locking signal
temporarily disappears (for example due to TX maintenance) the clock keeps
running and if necessary is corrected as soon as the LW sig is back .
I use a make Zenith clock (made in Germany) receiving MSF ,60KHz which
indicates whether the LW sig is received ,or not.
The clock is always in operation.

Note : If you consider purchasing such a clock for use in the shack ,make
sure it can be set to 24 hrs time indication. Not all makes can be set that
way . The Zenith clock can.

> This type of FM
> detector is not known for it's linearity.

Actually, the linearity can be extremely good, but it depends on the phase linearity of the quadrature network. I say "network" because people have used double-tuned networks and transmission lines to get much better phase linearity than you can get with a simple single coil. There's a tradeoff between linearity and sensitivity, too: if you use a lower-Q coil, you'll get better linearity and lower sensitivity.

As I recall, it was either a fancy Marantz or McIntosh (MR-71??) FM broadcast tuner that used the delay line for essentially a quadrature detection scheme. I know the marketing hyped it, but don't know if it was as wonderful as some other techniques or not.

Want _really_ good linearity? Do it digitally! ;-) (And for sure avoid non-phase-linear filtering in the signal path before the detector!)

Cheers,
Tom

7778. Re: Watch Crystal Adjustment

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-17 20:56:16 UTC
From: James Horn <jimhorn@svn.net>
Message-ID: <3c1e5bf0@news.svn.net>
Source record: 47973

Back in Sept 1979, RF Design magazine had an article to do just what you ask. A simple piezoelectric bender (beeper disk) fed a PLL (phase locked loop) to generate a clean 32768 Hz signal from any quartz watch placed face down on it.

As to getting it accurate to sub-hertz rates - the article covered that, too. The idea was to set the time accurately, then just wear the watch for a month or so. Record when it was first set. Then, when adjustment time comes, record the new time, date, and error that was corrected. Some simple math will show exactly how fast or slow the watch has been running (in parts per million, for instance).

Then, using a good (period) counter (which typically gives 6 to 9 digits of resolution per period of gate time), measure the crystal frequency. Using the above error rate, you can easily compute the necessary correction and correct frequency. Then trim to get it.

The author typically got watch errors down to 1 second per month on the first try.

Note that even the counter's accuracy isn't a factor.

Sorry I don't have the article any more - at a prior job someone decided to throw all my back issues away (aargh!!). But the elegance of that particular one has had it stuck in the back of my mind since then...

Hi,

I guess all discussions have been based on the assumption that the pulses
are one per second. What if the manufacturer used a different figure, like
two per socond. My "Seiko 5" (fully mechanical) looks to be about 4 or 5 per
second, as the second hand moves almost smoothly.

James.

Back when I was a young'un I had one of those, and it worked fairly well, although it did seem like some others didn't work as well, so there is apparently some variability in the crystals.

Anyway, in mine, the crystal was mounted in a cup that appeared to be tin or solder plated, and apparently immersed in a blob of solder as you describe. The cup was perhaps 1/2" in diameter and perhaps a little less high.

The "whisker" was actually a spring. There was a conical spring, with the wide end slipped over the end of the arm, a little less than 1/8" in diameter. The spring was perhaps 24 or 26 gage, ending with a wire protruding maybe 3/4" or so from the narrow end which was then poked onto the crystal.

The arm was perhaps 4 or 5" long, had a ball in the center where it was mounted, and a small handle, maybe Bakelite maybe wood, on the end opposite to the whisker. If I recall, and this part is getting really fuzzy, there were fahenstock clips at the cup and at the mount that held the ball. I seem to recall a black Bakelite base.

Really tough to describe without drawing a picture.

Galena can be mounted in two ways... NEVER NEVER NEVER
use a blob of solder to mount galena. Galena is lead ore, and
the heat required to melt solder can destroy or greatly reduce the
sensitivity of a good piece of galena ore.

The proper metal to use is WOODS METAL. This is the stuff that
gag melting spoons were made of, and it will melt below the
temperature of boiling water. You can buy properly mounted
galanas for about $1.50 each.

Or, you can make up a simple clamp arrangement to hold the
chunk of galena in position.

The proper material for the probe is a very light gauge wire, such
as brass. Do NOT use a stiff probe, or the constant probing
will quickly destroy the sweet spots on the galena surface. I use
brass wire sold in hardware stores for picture hanging. Cut the
wire on a bias using sharp scissors. You can still buy the proper
cat whiskers for galena and silicon detectors (silicon detectors
require a stiffer catswhisker.)

If an older galena crystal appears to have lost its sensitivity,
clean the surface with some pure alcohol. This will usually
restore a crystal to usable condition.

Tim,
not knowing too much about the Ramsey, have you checked the IF filter
bandwith? If the receivier is meant for nbFM it is likely to be 15 kHz
or so, and I think (not knowing) that the band with of the wx-sat is
more than 30 kHz....

With proper post-filtering I usually get nice clean AF from my 3359
ckt's. I think if you look in the Motorola databook you will see that
the waveform is not really pure sine wave at the IF part.

I think that "blob" of solder was really "Woods metal" a low melting point combination of bismuth, tin, antimony and whatever from memory. At least that's the way I made them in 1944, I suspect that most soldering temperatures might not do the galena any particular good.

I'd expect some noise, but not clipping or unevenness.

Sounds like a real winner. I'd consider taking a $10 FM radio and using
its IF circuitry instead.

Jim

Try using a tunable trap.. Add another coil in the same axis that
can be slid away or closer to the main coil. Use a 365 pF cap
across it. You can tune the trap to eliminate the offending station,
and set the coupling to the minimum needed to avoid sucking out
desired adjacent stations.

The problem may not be with the RF portion of the radio but rather in the sensitive crystal earphone or audio lead. You may be picking up the stations directly through the leads or earpiece. You might try, just for a test, shielding the earphone lead or puting a couple ferrite bead on the earphone lead, installing one of them as close to the earpiece as possible. This may be enough to eliminate any audio rectification.

Yes, but I have a nice watch already.... I also wanted to understand

1.) how it is done,

2.) can it be done

3.) where my measurements and lab test meaningful.

I did get a note today from the former editor of RF Design Magazine and he explained what others have said here that it is usually accomplished acoustically, and that a counter measures period, not frequency.

I may discover that the watch I want to adjust has no capability for it, as some posters have claimed, and I will just live with it.

Thanks to all who have posted; I did not expect so much activity.

Mike,
You are 100% right on copper cup arrangements. Steel cup would be my
2nd choice.
For the cats whisker you need a good quality steel spring with one end
mounted on a screw (for adjustment) and another end is made straight
and sharpened as an arrow to make a reliable contact with the Galena
crystal surface.

Let's see...

First you need a 3 phase 240 VAC 1 HP motor.
Have your house wired for 3-phase 240 VAC and run the motor from it.
Through a complicated series of pulleys and belts drive 2 automobile SIX volt generators.
Adjust the field current on each so you get 10 volts.
Use a DC to AC inverter to produce a square wave 10 volt output.
Apply the 10 volts to the primary of a 10 volt to 120VAC transformer. (Make sure it's not a DC transformer now!)
From that apply the 120VAC to the 120VAC winding of a 120-240VAC transformer.
Connect a 240VAC to 10VAC transformer to the output of that transformer.

And, amazingly enough you now have unregulated 10 VAC!!!!

And, yes, it's NOT April 1st here but perhaps in Illinois April 1 comes on December 16!

I guess we can tell who doesn't have a subscription to qst. There was an ad for a watch that picked up and synced with wwv, in one of the issues in the last year. One of the local hams bought one. My parents have one of the wall clocks that syncs and it was a sight to behold when powered up and the hands just spun around until it got to the correct time.

I on the other hand enjoy setting my local timepieces, since I have to set one different so that it is in time with the timeclock at work which is 6 minutes behind wwv. My vcr though is supposed to read the signals off the cable and keep current that way. No blinking 12:00 there.
thanks, John.

You have to show that 50 watts is needed for your use. Gmrs repeaters have to be evaluated periodically to justify their power level. The 5 watt rigs are less paperwork to use. To be honest if frs freqs are overloaded, have you tried 49mhz or 27mhz? If all three are overloaded, then get on the stick and train your entire family to be hams and provide them with 222 mhz rigs, I don't think you will find anyone else using that portion of the spectrum.
thanks, John.

news:<FBLXZNFmrxG8EA4a@ifwtech.com>...
...(loads of good stuff about L networks deleted to save bandwidth)

A couple more comments...

Some loads are quite reactive, and that can cause trouble, in a couple of ways. First, if you have a load whose reactance is high compared with the resistive part, you're going to have a high-Q matching network...or else a matching network with lots of loss itself. That means it's going to tune sharply, and in the case of the L network, _both_ the inductor and the capacitor have to be right to get a good match. So if you use a tapped inductor, and have a high-Q load, it may be frustrating to try to find the match.

Second, if the load is quite reactive, the difference between that and the same resistance without reactance might be thought of as "adding to" or "subtracting from" the reactance of one of the tuner parts.

To help you see this, realize that what you have is a loaded tuned circuit. The load is the resistive part of your load, and the tuned circuit is the tuner's L and C PLUS the reactance of your load. Of course, things don't always add in a simple way, but you'll find that the load reactance has to be allowed for. In fact, if the cap is on the transmitter side, with a series L, then that series L's reactance adds directly to the load's reactance. So if the load is already inductive, you can end up needing a capacitor instead of an inductor in series, to get the same effective match as if the load were just resistive.

Cheers,
Tom

Thanks for all the good suggestions; they give me new ideas and help me re-think ideas that I would dismiss otherwise.

A few comments and responses:
After dismal results with an aluminum covered cardboard box, I decided start with a good shield where I could hear nothing, and then try aluminum foil again. Since the crystal set was large and required external leads, I used a portable radio. Tests were made with nothing connected to the portable radio. The setup was similar to that used by Dave Hoford and his noise source. I can think of three reasons why our results differ when I use the cookie can. 1) The seal between the lid and remainder of the can was not RF-tight, and possibly was isolated by the paint. However, I also used a large circular can used to hold food for commercial users. I sanded the junction between the lid and can. I think I'll tin this junction to improve the chances of a good joint. 2) The antenna sensed the magnetic field, which might be harder to attenuate than an electric field. 3). The receiver has a sensitive antenna, while the noise source has an awful antenna. Dave, did the noise source radiate a really strong signal when operated outside the can?

The skirts of a simple tuned circuit become really broad down 30 dB or more, and maybe this is the problem. I don't think so. I'm using a coil wound with 16 gage magnet wire double spaced on a 4" Plexiglass form. Q is roughly 400, which isn't bad when not using suitable Litz wire. For comparison, Q of antenna coils used in pre-loop antenna radios is more like 40. The signal really peaks when tuning across KNX-1070, and then drops down to a barely discernable signal and seems to remain there as I tune further and further away. My crystal set noise floor is KNX, at a barely readable level. I'm using RCA sound powered headphones through a matching transformer(s). Sound powered phones are considered the ultimate among crystal set aficionados. They are noticeably more sensitive than my old-style magnetic and Brush crystal phones, and I have a number of each.

I have two tuned circuits. I series tune the antenna with an inductor, and have a normal parallel tuned circuit for the detector. I've tried a wave trap inductively coupled to the detector coil, and it doesn't help the KNX "noise floor" problem.

Pickup from the headphone leads is a definite possibility. I'm thinking of running a test using a signal generator. I'll tune the set to KNX with the normal antenna connected and measure crystal current (an S-meter of sorts). I'll connect the signal generator through a series capacitor to simulate the antenna, set the crystal current for

a higher level, and then tune across the band. If I hear nothing, I'll look into filtering the headphone leads.

Pete Gianakopoulos, thanks for your generous offer of Litz wire. I have some, but it's expensive and I don't want to use it until I experiment more with standard wire. I think taps help, but don't want to use more than one or two with a Litz wire coil. My current coil is tapped every turn, which is far more than needed. What size wire do you have?

I was going to try the signal generator test, but misplaced my sound powered phones. After a couple hours looking, I found them late this afternoon.

I'm sure some of you are members of the Yahoo Crystal Set Radio Club. Who are you, and what is your Yahoo name?

Suggest you join the Yahoo 'The Crystal Set Radio Club'. There are some photos of detectors at that site that should give you some construction ideas. Bring up www.yahoo.com and search for 'the crystal set radio club' (without the quotes). #1 is the club, #2 a crystal set organization that puts out a newsletter every few months, and #3 and #5 are web site of two of the members. Other members have good web sites, too. Check #4 too, it's an Australian crystal set club with some nice photos.

I think you can do it much simpler than that:

Items needed:

1 high-quality and high-power hifi amplifier (look for one with "extra
bass").
1 50/60 Hz sine wave generator

Optionals:

- Graphic equaliser (to get rid of the armonics in the oscilator)
- moster audio cables and gold connectors

Just plug the generator to the amplifier (take care with signal
levels) and adjust the volume of the amplifier until you get the 10 V
required at the speaker outputs.

If the amplifier is good enought you will have thermal/overcurrent/DC
protection :-)))

First, I assume you are using a highspeed scope to observe the
RF waveform....

Why would you expect to see a sinewave reproduced accurately
in an FM IF strip? It is desirable to run the IF stages well into
compression/clipping to reduce any AM components (noise) on the
signal. That's why there is no AGC in most FM receivers--the
clipping is desirable. Most good FM stages have one or more
limiter stages just for this function.

I am working on building Rick Campbell's R2 and T2 based transceiver.

For the VFO I was thinking about using the Hartley type oscillator suggested in the R2 article. I was wondering if anyone has successfully built the oscillator to cover multiple bands (say 1.75-14MHz) without the use of mixing or multipliers. This seems like it could easily be done with 1000pF of tunable capacitance with some band select and some tuning capacitors. Is it possible to get a circuit like this stable enough? Would I need to change the coil for different bands as well?

Well, it sure ain't pretty I'll tell ya that! I've scoped other 10.7Mhz
filter outputs in different radios and they seemed halfway decent.

Do you mean run SA602's output to the IF front end of another radio?
Also, something that's REALLY bugging me, and forgive me if it's a
rather silly question. But what determines if it's going to be high-side
injection or low-side? Seems the receiver is just RFin --> NE602 (with
L.O.) -->10.7Mhz filter. I can understand the difference in freq.
between the LO and the input but can't figure out how it's destined to
be high-side or low-side injection. Does mixer say, "Ok Mr. RF in, you
have to be 10.7Mhz lower than my LO or else!" ?

I was messing around with diffeernt 10.7Mhz filters and put what I think
is the original back in, but still a poopy looking satellite image -- no
grays. So I'm wondering if the 10.7 filter I have in there is the right
one; have tried many others.

Thanks,

Tim Hamel

Well, it's obviously not bad enough to mess up receiver too much. Makes
sense, no need to preserve the peaks of the FM waveform since it's the
deviation we're concerned with. I can scope pin 8 of 3359 and see a nice
FM wave. Funny thing is, as satellite passes over and I max out quad.
coil (flush with top), the signal sounds perfect but it's apparently not
because the resulting image's histogram is black/white with no grays
which makes for a worthless image. It's weird, everything sounds fine,
it just seems like the frequency is shifted along the way and it kills
some of the 2400Hz signal.

Thanks,

Tim Hamel

Good point.

For a human doing the calibration they can just set a scale factor.

Perhaps the automatic ones, like the one I describe, do some kind of heuristic, dividing by a large enough integer until it gets close to the right value. If I was writing the code for the controller, that is what I'd try first.

It would also explain why my quartz/mechanical watch confused the calibrator, it may have had uneven pulses, or beats from two geared objects inside the device. It had a second hand that moved a fraction of a second per 'tick', not a tick per second like a Swatch (the ones that have a second hand that is).

Hi

I'm seeking 2 Plessey free (as opposed to fixed) sockets for a R.N. (CAS) receiver. The socket is a Plessey Mark 4 circular connector with 12 pins, marked from A to M (I missing). It probably is a right-angled socket, and will have a screwing collar. The inside thread on the collar is about 25mm. There are 2 versions, differentiated by the thread, I'm seeking the fine threaded ones, NOT the coarse square threaded ones. Looks military.

Please email me if you have one or two. Thanks.

That is, the diameter of the circular collar thing with thread on it, which
screws onto the plug collar, is about 25mm diameter.

Wouldn't even have to reverse-engineer Heath's stuff. The timecode stuff
is all documented by NIST. Problem is, such a clock would have to be
priced competitively with GPS receivers, which probably give more accurate
time anyway because they're able to factor in propagation delays.

> have to be 10.7Mhz lower than my LO or else!" ?
>
The first thing that determines if the LO is high or low side injection
is at the design stage, where someone does calculations to see if
one is a better choice than the other.

But it's the front-end tuned circuits that determine what will be
mixed with the oscillator to get the IF. The unwanted mix is the
image frequency. You probably can never completely eliminate the
image response, but the better the front end circuitry, the more
attenuated the image frequency is. A higher IF helps in this,
because then the image is further away from the desired frequency
and it's easier to make good front end filters.

So there are plenty of old shortwave receivers around, that were low
end when they originally sold, with 455KHz IFs. By the time they
get to the top band, 20 to 30MHz or so, they have really lousy
image rejection because there is little front end selectivity,
and the choice of IF makes the image almost right next to
the signal frequency. On the other hand, there are plenty of old
shortwave receivers with 455KHz IFs that had good front end selectivity
(the HRO comes to mind, with it's two RF stages and associated
tuned circuits), where image rejection is good in the same frequency
range.

All those FM receivers, both broadcast and communication, have 10.7MHz
IFs (now, I suppose a lot of two-way stuff uses 21.4MHz or 45MHz IFs)
is because the signal frequency is much higher. If they'd gone
with 455KHz IFs, they would have needed ridiculous amounts of
front end selectivity, or live with lousy image rejection. As it is,
with the image 21.4MHz away, the front end tuned circuits don't
have to be all that fancy.

Not being familiar with the circuit you are attempting to build, I will make some general statements based on what I think you have.

It's probably best to switch coils, not capacitors. This has been done successfully many times in multiband radios for consumer use and older communications receivers and transmitters.

Stability is definitely an issue if you are planning to use this for SSB. You can't make an oscillator like that stable enough for HF SSB use without a great deal of effort. Or even WITH a great deal of effort.

When Collins came out with their variable IF double conversion receiver, the 75A, finally hams had a radio stable enough for serious SSB work. This used a non-switched VFO for tuning and used crystal oscillators for first conversion. So basically, it was a low frequency stable receiver with crystal controlled converters ahead of it for the various bands.

The system worked so well that it has become standard for all ham transceivers. Some get fancy and use more than double conversion but the idea is very similar.

Hi Tim

Most FM transmitters use frequency multipliers and class C amps
after the modulator... Linearity is not very important, as you can see!

I wonder if you might be having some alignment problems, or if
there might be undue ripple in the IF filtering passbands... These
would show more on weaker signal signals than stronger ones.

How hard would it be to modify a cheap FRS unit to transmit very simple telemetry on 70cm? I'm only looking to send a simple status (or possibly just a F3A ID) when a trigger is on, and nothing when it's off. Range isn't really an issue, as it's only about 300ft max, and of course, it would only need one frequency.

27 or 49MHz might be a better option, but I don't have anything handy that's as usable for either as the two extra FRS units.

Right. In my memory, all the FM IF strips I've inspected had clean (or at least relatively clean) signal up until the limiter stage. Because of that, I didn't think to question whether "the signal from the 10.7 MHz ceramic filter" had yet passed through a limiter. There's a good question for Tim.

I recall a friend using a neon-bulb relaxation oscillator in a pinch
to create a CTCSS tone. Of course it had a bit of a buzz sound to it.

There are some simple ICs which can be used. I believe the old ARRL
handbooks had a circuit, but haven't looked at a recent one to
see if it still is published. The Communications Specialists tone
boards are a pretty good choice, and at $30 (at least that was the
price the last time I bought one), you can't go wrong.

You can use an op amp in an oscillator circuit (wein bridge?) to do a
passable job.
The waveform must be very clean and free of harmonics, and you have to
inject the
tone at a point in the modulator that will pass it with minimal distortion.
If not, the
tone will be audible (harmonic energy) on the receive end since those
artifacts fall
outside of the high pass audio filtering.

It's been a few years, but yes, I believe that you are correct in that this was a typo. Doug W1FB used this design in other work. He was writing some articles for other (non ARRL) magazines in the 1980 and 1990's and I would see his older work updated (or typos corrected) in these articles.

You won't notice any practical difference if you use the FT-23-43 core
even if it wasn't a typo. I suspect it was a typo anyway....

That digit refers to the diameter of the toroid so the value of the
inductor will be for all practical purposes the same on either diameter
core.

So, I SHOULD be seeing relatively clean FM signals!(?) The only limiter I know of is internal to the 3359 chip. As I said, when I scope the quad. detector pin (pin 8 of 3359), it's a beautiful sine wave (too bad she's not single)! I assume these Ramsey receivers aren't too popular with this crowd, no? It's actually a simple design. I've learned what I know about receivers because of it, so I gotta hand that to Ramsey. It's just this recent thing that's got me pulling my hair.

When I first got the receiver, the first thing I noticed was, "This little 1-turn pot. ain't gonna cut it." So, I went to a 10-turn pot., it worked out better. But then, for fun, I rigged up (to printer port; PC control!) a Microchip digital pot. (256 position) MUCH more stable! Even though it's spec'd at 800ppm, it was still fairly stable. Now I'm working on a 1024 position pot. design. I noticed there's a few PIC projects in the ham community, so I plan on adapting this pot. to a PIC design and offer it back to the community. A replacement for pot. tuned radios!

I do thank everyone for their ideas/suggestions.

I once built one using a 555. Passed it through a pi-net low-pass filter (using the primary of a filament transformer..) to get rid of the harmonics. Worked pretty well - managed to borrow a scope and it really was a pretty clean sine wave.

But it was connected to a tube-type transmitter, otherwise the CTCSS encoder would have been bigger than the rig.. Also helped that I had 12 volts of square wave on the input, I could afford to use a filter with HUGE insertion loss!

The most common problem I have seen with DIY encoders is insertion
BEFORE the dev control (IDC). The result is that any deviation
limiting strips the CTCSS off the signal waveform. It MUST be
inserted after such processing.

RADIO HABANA CUBA
DXERS UNLIMITED

MID-WEEK EDITION
TUESDAY, DECEMBER 18, 2001

By Arnie Coro CO2KK

Send your comments, questions and ideas to: arnie@radiohc.org

Hi, amigos! With less than 2 weeks left of the year 2001, old man Sol, our nearest star, continues to provide radio hobby enthusiasts with very nice propagation conditions.... Early morning Tuesday local time in Havana, I was able to pick up some interesting signals that indicated a very fast rise of the daytime maximum useable frequency curve.... and although solar activity is expected now to move down for the next few days, the fact is that there is so much ionization at the higher levels of the ionosphere that free electrons are really plentiful, even after the Sun sets.... Solar flux still above the 200 mark, and the effective sunspot number has now moved down to around 160, still an impressive figure by all standards...

Item two: I have just updated my list of all the ways that you and I may enjoy our wonderful hobby!!! And it has grown to 63 different and clearly identifiable ways of having a nice time with our hobby, from monitoring natural radio signals on the extremely low frequencies of ELF to playing with LASER BEAM communications in order to add points to your station when participating in a VHF-UHF-SHF amateur radio contest.... And don't forget such nice ways of enjoying the hobby as antique radio restoration, radio kit-building, computer-aided design of antenna systems, building amateur radio equipment from original designs and some very interesting aspects of the radio hobby like doing intruders watch on the amateur radio bands to help keep the ham bands clear of illegal users !!!

Yes my friends, the list now adds up to 63 different ways you and I may enjoy the hobby....radio has the unique feature that it is a never-boring hobby .... with some aspects of it costing next to nothing, like the way many of us seem to have started here... SHORT WAVE LISTENING, the flagship of all radio hobbies!!!!

Item three: You have questions and Arnie answers them section of Dxers Unlimited will reply today to a question sent by several listeners in relation to the so-called coaxial cable antenna, a very

easy to make dipole that requires just a length of coaxial cable and one antenna connector, plus a small length of PVC insulating electrical tape and a small amount of silicone weather sealant, and as always at the end of the show, I'll provide you the most up to date HF propagation update and forecast which, even when heard during our late-late show at just after 0530 UTCm is never more than 12 hours old....

Stay tuned right on this same short wave frequency or if you are listening to me on the world wide web streaming audio, keep your computer connected to Radio Havana Cuba... Margarita Delgado is my sound engineer and producer , I am Arnie Coro, radio amateur CO2KK, back with you in a few seconds...

This is the mid-week edition of Dxers Unlimited, you can always reach me via e-mail by sending your message to arnie@radiohc.org and I will reply to you directly with an answer to your radio hobby-related questions as soon as I see your message displayed on my computer screen....

Now here is item three, our popular YOU have questions and Arnie answers them section of the show.... Today, I will be answering a question sent in by listeners in Cuba, Canada, the United States of America and several European nations, plus Australia... The question has to do with a very simple way of making a low-cost yet effective dipole antenna, that has proven to be very useful for portable work in the frequency range from 10 meters all the way up to the 2 meters amateur radio bands, and all frequencies in between.

This coaxial cable dipole, can also be made for lower frequencies, but it is a bit more troublesome to do the tricky operation of pushing the coaxial cable braid back over the outer jacket of the cable for a length of more than about 2.5 meters or eight feet required for the 10 meter band version.

The "Coaxial cable push back dipole," as it is known among radio amateurs, is an excellent emergency antenna for the 10, 6 and 2 meter bands, and ranks among the lowest-cost skywires that the radio hobbyist may build and install, as it only requires enough coaxial cable and an antenna male connector.... The coaxial cable push back dipole is one of my favorite portable antennas for the 2 meter band handie talkie when travelling, as it has the advantage over the 300 ohm TV twinlead J pole, that it is smaller in length and does not require any soldering at all... something that has helped me to build these antennas even right in the middle of a communications emergency with the help of my faithful pocket knife, if a length of coaxial cable with a connector at one end was available from a broken antenna... The only thing needed is that one end of your coaxial cable will have an appropriate type of antenna connector for the radio that you are using soldered to it.... Now, ready to copy, ready??? Here is how to make a coaxial cable push back dipole following these easy step-by-step instructions:

First calculate the length of your dipole antenna for the center of the frequency band you want to operate your radios on... Here is the formula: Divide the number 143 by the frequency in megaHertz, and your result will come out in meters... For example, let's make a coaxial cable push back dipole for the 2 meter amateur band.... Center frequency: 146 megaHertz.... so -- very easy -- divide 143 by 146 and you will find out that the overall length of the dipole, of course, your result will be less than one meter in length, exactly 979 millimeters, or in round numbers 98 centimeters.

Now, step two: Very carefully remove the outer plastic jacket of the coaxial cable for a length about one and a half meters, to make things easier for the next step. That is, strip the cable of its outer jacket for roughly one and a half meters and then proceed to fold back the coaxial cable shield or braid over the cable's plastic insulation, in a way similar to what you do when you are removing your stockings.... The braid will then leave a length of the center of the coaxial cable exposed to form the other half of the dipole antenna....

Step three is a very easy one: Just trim the braid that is over the coaxial cable's outer jacket so that it will be 49 centimeters long... And also cut the center conductor to slightly more than 50 centimeters, so that you can trim it later for minimum standing wave radio in case you want to transmit with this antenna...

Step 4 is also very simple: Find a length of PVC plumbers pipe of about 100 millimeters or 4 inches long, and just wind as many turns of the coaxial cable as will fit, starting from the point where the shield or braid ends. This is the coaxial choke balun, essential for the proper operation of this type of antenna....

As you may realize, this is just another way of building a half wave dipole antenna, so its gain, compared to a standard half wave dipole will be zero db d, or zero decibels over a dipole, as this is the reference antenna for practical radio work....

By the way, you must install the antenna according to the polarization used by the stations you want to listen or talk to, so in the case of the two meter amateur band FM, the coaxial dipole must be installed vertically, as by convention, and to facilitate communications with mobile and hand held stations using vertical antennas, the 2 meter FM amateur sub band stations all use vertical polarization.

Of course that you can make a coaxial cable push-back dipole in just a few minutes for any particular frequency in the range of from about 25 to 250 megaHertz, by applying the formula, and proceeding to first remove the outer plastic jacket for enough length, pushing back the shield or braid over the cable's plastic jacket, and trimming the length of the center conductor and the exposed braid to the appropriate length to make the dipole resonate. Don't forget that the coa_ial cable choke is essential for the proper operation of this

antenna, and here I must add that the choke for the lower frequencies in the range from 25 to 50 megaHertz must be wound on a length of PVC pipe of no less than 3 inches in diameter, that is 75 millimeters, winding at least 8 turns. In the range from 50 to 100 megaHertz reduce the diameter of the pipe to 2 inches, that is 50 millimeters , and as mentioned previously for the antennas in the range from 100 to 250 megaHertz, the coaxial choke diameter must be one inch or 25 millimeters.

I have done some experiments regarding the number of turns required for optimum operation of the antenna, and it is between 6 and 8 turns... Please notice that this coaxial choke is just the same cable wound over the PVC pipe "coil form" to effectively isolate the antenna from the feedline.

By tying a nylon fishing line to the end of the exposed center conductor you can install the coaxial cable push-back dipole vertically at any location, for example, it may hang from a tree branch, or supported by a plastic or wooden mast...

If you want to use the antenna, as I do here, as part of your permanent receiving or receiving and transmitting station, then carefully seal the place where the coaxial cable shield or braid separates from the center conductor by winding several layers of plastic insulating tape, and then sealing with silicone compound....

Many Cuban radio amateurs use this antenna for 2 meters FM by placing the dipole inside a length of PVC pipe for additional weather protection, but they soon found add that the presence of the dielectric so near to the antenna changed its operating frequency, so the length had to be trimmed experimentallly for minimum standing wave ratio...

Si amigos, yes my friends, oui mes amis, one of the easiest to make and lower cost antennas -- the coaxial cable push back dipole is an excellent performer, and all it takes to make one is a length of coaxial cable, an antenna connector of the type used by your rig and some plastic PVC insulating tape and a bit of silicone sealing compound for the portable version of the antenna.

An antenna for permanent, fixed, station use will be better protected if placed inside a length of PVC plumbers pipe of about 25 to 50 millimeters diameter, but again, you must carefully trim the length of the center conductor half of the dipole and of the braid for minimum standing wave ratio!!!

Any doubts, any doubts on the how to make your own coaxial cable push back the braid dipole? Then just send me an e-mail and maybe I can send you a nice .jpg picture of yours truly and the most recently built antenna!!! Send mail to arnie@radiohc.org or VIA AIR MAIL, a postcard is fine, to Arnie Coro, Radio Havana Cuba, Havana, Cuba.

And now as always at the end of the show, here is Arnie Coro's HF plus 6 meters propagation update and forecast: Solar activity moving down now, but still high enough to support very high daytime maximum useable frequencies, amigos!!! There is still one solar active region with the complex magnetic configuration required to produce solar flares. Running typical HF propagation forecasting software is not that difficult at all, and at least one of the most recent ones is absolutely freeware and works very well... it is W6EL's brainchild, and Sheldon C. Shallon, radio amateur W6EL, who owns the copyright, but kindly has made the program available free, in the public domain...

Well a test run of the W6EL's HF propagation software that I did just before finishing to type this script showed that the maximum useable frequency from Havana, Cuba to Buenos Aires, Argentina stays above 30 megaHertz from 13.30 UTC to 22.30 UTC, reaching a peak of 38 megaHertz at 19 hours UTC, so you see what I mean, the second peak of solar cycle 23 is doing a very good job to push those daytime maximum useable frequencies way up... Enjoy them amigos, and don't forget to try our new streaming audio from www.radiohc.cu!

The "Louisville Homebrewers" have completed their tube type transmitter building contest. The winner was a four tube 40 meter cw xmiter. The other xmiters were of the single tube type. Pictures will be posted at a later date. Thanks to all who donated parts to the builders. Many lessons were learned from this club project.

Hi Dave,

It's all a measure of how practical you want to be, more time or more money. If you want to blow $35 to pick up a Com Spec pl encoder and wire it in, you wont be sorry. They are rock stable and pretty straight forward to install. Plus the paperwork is very clear and easy to follow.

If you want to build an encoder... the most practical chip to use is a 555 timer chip. By nature it's stable against voltage changes (it works on on/off charging ratios) and will put out more than enough power to modulate even the most stubborn phase modulator.

A lot of people worry about the output square wave, but the circuit I have uses three poles of RC filtering which clean it up real nice. The result is a practical sine wave that is relatively stable in frequency and amplitude.

There are people out there using op-amps set up in many ways to obtain similar results, but they have problems with frequency drift when the supply voltage changes a small amount.

I have diagrams for all the above, the classic 555 circuit that I've built a gazillion of in my day, the op amp version and the single transistor Twin Tee type circuits. Just Email me if your serious about building one. (take the NOSPAMPLEASE out of my Email address).

cheers

> she's not single)!
So...at the quadrature coil, you SHOULD see a clean sinewave! It's a
reasonably high-Q tank, lightly coupled to the incoming IF signal.
That IF signal moves in frequency. At different frequencies, the
phase shift between it and the quad coil (which stays on the same freq
as the IF signal, with only a very tiny time lag) changes because of
the changing phase of the impedance of the quadrature tank (coil) as
the freq changes. The differing phase difference between the IF input
and the quad coil is what is used to detect the modulation. It's a
true FM detector, not a phase detector, and will maintain a DC output
if the carrier is "off frequency".

If you can get ahold of a signal generator at the second IF (455kHz??)
that will do clean FM, you can check to see if things are working
right there. A scope would help a lot too, to look at the recovered
audio to make sure it looks like the audio you put into the generator.
(Guess that's easy for me to say, since I work for a test instrument
company...but it really is helpful to have ways of measuring things,
even if you have to kludge them together yourself.) It's pretty hard
to troubleshoot something knowing only that "I put in something that I
think is a good signal, and get trash out." Things become a LOT
easier if you can break the problem apart into ever smaller pieces
till you isolate it. And you can do that working in from either end,
by either changing where you apply the signal or where you look at the
result. Being able to do either is nice, because sometimes one gives
quicker answers or answers that are easier to interpret than the
other.

> radios!

Radio Shack used to sell a pot-tuned Weatheradio (or whatever they called it). At least it had limited tuning range, but still, it's a bit tough to tune things with a one-turn pot. On the other hand, if you say you want 10kHz settability and you're tuning a 2MHz range, that immediately tells you that you need at least one part in 200 resolution, more if the tuning turns out to be nonlinear as it often is with pot tuning. So the 1024 step output should do OK. Something to beware of, though, is how clean the output is. If you do it with the PWM capability of the PIC, be sure to filter out the fundamental frequency. And you need to filter it better than you might have thought: say it's at 1kHz. Then if there's "half a least-significant bit" of remaining ripple, that's around 1kHz of peak FM deviation, and you'll have a 1kHz tone superimposed on your received signal! In fact, it's possible that the problem you are NOW seeing, if you're not using your ten-turn pot, is noise getting into that tuning circuit, effectively adding modulation to the signal. Worth mentioning, anyway!

Cheers,
Tom

There's been quite a lot of discussion about these transformers on this newsgroup in the past. I suggest doing a search at groups.google.com (formerly deja.com) and checking it out. One recurring topic was how to deal with the problem of one of the secondary leads being internally attached to the metal transformer housing.

That's what I've learned in recent days. It's all about the I and Q. I'm thinking about callin up Ramsey and ordering a new SA602, ceramic filters (1st IF and 2nd IF), and another quad. coil. I think replacing the main parts will fix it, not to mention, saving me from more hair pulling!

Oh yes! My scope has been a tremendous help. Last night, I discovered that instead of the colored dot on the ceramic filter being RED, it was ORANGE! The scope proved this by the attenuated signal going into the 3359. Hard to tell colors apart in low light. So, I replaced it with another filter with a RED dot and got a better signal. I even found the original filter and stuck that in; still a sad looking satellite image. All this leads me to believe my problem is AFTER the 1st IF "stuff."

I do have a MAX083 sig. generator IC that I might be able to cobble together a 450kHz osc. with. Then I'll figure out a way to modulate it. Not to sound too stupid, but where I would inject this signal?

Actually, these pots. are real pots., just digital. No PWM or anything. They're SPI in, resistance value out. Check out the AD5231 (http://products.analog.com/products/info.asp?product=AD5231) if you're interested. I'm currently using a Bourns 10-turn pot. which seems to be ok for now. The radio is designed to allow you to tune a 5Mhz segment given the LO setting. This obviously A LOT to tune with a single turn pot., so 10-turn was natural. I think a 1024 pot. will be even better! Of course, what's the point of fancy tuning if your radio doesn't work right? =)

-Tim H.

7844. Re: Multiband Hartley Oscillator

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-20 07:34:53 UTC
From: brocks@mailandnews.net
Message-ID: <3c218219.10207349@pen6.pen.k12.va.us>
Source record: 47940

From what I have read it seems like in a well-designed VFO the coil is usually the cause of drift. This may mean that with a high Q air-coil (most designs I have seen use a powdered iron core) a person could use very small amounts of tuning capacitance require for enough selectivity on higher frequency bands with adequate stability. I have seen a simple regen RX circuit that covered the HF bands with a Hartley looking circuit (the coil was replaced with a transformer) by only varying capacitance but the RX had very poor selectivity at 10M! Perhaps a single coil with switched taps?

Sure modern radios are nice but much more complex. Direct conversion rigs are much simpler when trying to put together a homebrew rig.

Hi all,
I'm looking for data on the following YIGs. IF you can help I would really appreciate data on voltages, currents and pin outs

Make HP, P/N 5086-7267
Make HP, P/N 8555-60081
Make Avantek, P/N Y084-2715
Make Avantek, P/N ASF-8368M

On the avanteks, I'm looking for tune and fm currents, on the Y084 I'd like to know what the fm filter pins are for? I thought it might be a generic housing but the pins are wired to a coil (i think - it's got 1 ohm across them)

On the HPs, voltages, currents and pin out

Please email me any info that may be helpful

Thanks in advance

Greg

I have an '89 Avantek catlog that lists the normal YIG oscillator
products. None of them seem to match your part numbers in any way.

Sorry. Sure there were many custom products. Just thought I'd share
this null info.

Not sure where you get the "fm filter" terminology. Many yig
oscillators have two sets of coils. One is the main tune current. A
separate coil is often provided which gives finer tuning control and
this is labeled FM. Sorry if you already knew this.

There are, of course, also yig filters which would have two sma
connectors for input and output. None of the numbers I saw in the
Avantek catalog matched these either.

The final problem will be getting the deviation set to the right level.
Nothing sounds better than a 7A tone as someone is talking. Maybe those
new rice boxes aren't as bad as all that, after all. :-)

7850. lithium ion [OT]

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-20 17:52:18 UTC
From: John O'Flaherty <wewelcomespam@blackhole.net>
Message-ID: <3C222552.B0D316D1@blackhole.net>
Source record: 47946

This is off-topic, but it seems like a good place to ask. I have a laptop computer with a lithium ion battery pack, about 3 years old. I only get about half an hour of use instead of the greater than two hours I should get. I'd like to get a new battery pack, but they want about $180 for it. I tried to find a source for the six battery cells inside it (3-volt 1500 mah units) and everywhere I turn I'm told that these cells are never sold to consumers because charging them is such a specialized task that only oem's can be entrusted with it.

Well, the charger circuit board is built into the battery pack, and I haven't changed it, so I don't see why just replacing the cells wouldn't restore the unit. It sounds like an excuse to keep the prices of the battery packs really high.

Does anyone know of a source for this type of battery?

Well, that sounds like kind of a shotgun approach...it would be nice
to KNOW what was wrong before replacing a bunch of things, it seems to
me.
...

> together a 450kHz osc. with. Then I'll figure out a way to modulate it.
> Not to sound too stupid, but where I would inject this signal?

I imagine the MAX083 should be able to generate a decent FM signal,
though perhaps not terribly low noise. But still, probably fine for
signal tracing. One problem is knowing fairly accurately what the
deviation is.

The idea would be to send a test signal at the IF frequency into
wherever you can closest to the detector first, and then move toward
the antenna input end of the chain. If things are fine at output when
using the first injection point, you can be pretty sure that
everything between where you injected the signal and the output is OK.
Eventually you get to a point where things are not OK, and in between
the first bad injection point and the last good one is where the
problem most likely is. You need to keep the levels reasonable for
where you're injecting, of course.

OK on the pots...well, one is never _quite_ sure what is actuall
inside an IC, but I imagine those that you're using are fine. I'd
agree with another posting I saw, that if your filters are too narrow
for the signal you're receiving, you'll get a lot of distortion. Try
listening to an FM broadcast band signal on a NBFM ham receiver
sometime...you can kind of make it out, but it sure doesn't sound

good.

What I've always found works well in troubleshooting is to observe what I reasonably can, then think about what could be causing the things I'm seeing. It's also very productive to think about what might have changed between when things worked and when they didn't. Then I think of 'speriments that either confirm or disprove those suspected causes. Certainly replacing parts (with ones that I'm pretty sure are good) is one way to test things, but I generally learn a lot more by trying to understand how things work a bit more deeply. And...it can be really frustrating if replacing all the parts doesn't fix the problem!

One thing I'm not 100% clear on here: did you say that it used to work well, and then _on_the_same_signals_ quit working well? Or did it used to work well on some signals, but you never tried it before on the ones it's not working well on now? Sorry if you 'splained that before and I missed it.

Cheers,
Tom

Hi Rex,
yes, custom products.....hmmmm - didn't think about that - DOH!

I was also surprised by the "fm filter" pins.It identifies them as filter, as there are also (as expected) a set of "fm osc" pins. The case has a second sma connector housing but its blind. The label states oscillator: 2-8 GHz, so thats where i assumed that perhaps a standard housing was used. But when i measured ~1 ohm between the pins iI became a little confused why fit the coil?
No date of manufacture indicated unless thats extracted from the serial number? SN 2072B

Thanks for the help
Cheers
All the best for Christmas & New Year from Australia

Thank you for your understanding.

7855. AM reception in a metal building

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-20 20:48:37 UTC
From: Wayne <wrace@softhome.net>
Message-ID: <F8sU7.121$896.607125@paloalto-snr2.gtei.net>
Source record: 47853

Hi folks,
I have a situation where I would like to get AM and SW reception in a metal pole building (siding and roof are all metal). To compound the situation, the shop has Twenty 8ft. two tube noisy fluorescent lights. The lights just overpower the am radio regardless of where I locate the radio. Eliminating these lights is not an option.

Installing an outside antenna is however. I have a couple of long wire antennas that I could use. Thought about putting a long wire on top of the shop building which is 36ft. long. Is this long enough for a effective long wire antenna? Any problems with putting it on top of a all metal building?

What can I do to block out the noise, so I can listen to AM radio in my shop? I realize this may not be an easy problem to solve. I am looking for any ideas..... What about locating the am radio in my house and running some speaker wire underground to the shop? I generally listen to three different am stations depending on the time of day, so changing the channel would be a hassle.

Any thoughts??

Thanks
Wayne

Source record: 47859

Three years is about right. I understand that a lithium ion battery has
a three year life span from the date of manufacture. These batteries
can explode if overcharged, and catch fire if shorted. In the battery
pack is usually circuitry to protect against this. Make sure you keep
this circuitry!

I would suggest finding surplus cell phone battery packs cheap (7.2v has
two batteries if Li-Ion), and rob them for batteries for your computer.
Make sure it is Li-Ion, not NiMH or Nicad. These are newer and harder
to find.

Again, keep in mind the batteries have a life span of three years, used
or not.

I'll probably figure out a way to have a 555 modulate the signal, then
I'll be able to dictate the deviation.

> _good_.

I guess I should have emphasized the fact that I WAS receiving the sat. signals quite well. During my experimentation (it's a good education), I swapped out filters, different caps for the LO,etc. -- then I set it down for a few months and came back to this. I went back to pure stock for troubleshooting purposes. At first I thought maybe my soundcard was filtering the audio somehow, but I tried it on the PC I originally started with, same thing.

>

> fix the problem!

That's what I'm afraid of. Working on this radio sure has given me an intimate understanding of receivers, I just lack a bit of knowledge in some aspects. I've thought about "what's causing this" to the point of utter frustration. I've thought, "Let's see, we got RF on one side, the LO on the other, out pops the difference..." I should mention, the difference in freq. I see is 21.4Mhz (2x1st IF), though I'm thinking that's because the output is a mix of frequencies.

>
> One thing I'm not 100% clear on here: did you say that it used to

> before and I missed it.

Yes, that's correct. They were beautiful at one point. I was actually quite impressed with the image quality from a $35 receiver. Now it's like the filters are chopping out a good portion of the signal. It should be noted that the signal sounds perfect by ear but the image tells a different story.

Likewise, Roy. If anyone want a quick primer on Li-Ion go check
Maxim's MAX1737 data sheet.

The board in the pack is almost undoubtedly a protection circuit
(only), not a charger. I would expect the charging circuitry to be
in the laptop itself.

A while back I opened up a bad pack for my now-ancient WinBook and found a Mitsumi MM1248B chip on a board. It's a charge/discharge controller for three Li-ion cells in series. The pack had a series connection of three groups of three parallel cells each. The controller handles each cell or series group separately.

http://www.mitsumi.co.jp/Catalog/ic/battery/mm/1248/text01e.pdf is the data sheet for the IC.

> notebook computer Li-ion batteries that don't hold much of a charge any
> more. Sell them on ebay . . yeah, great idea.
=======
Hey ,wait a minute ,that old Li-ion battery pack might have an extended life by 'reconditioning'.

Maha Energy advertising in QST ,now have an automatic re-conditioner/charger & analyser , model MH-C777Plus ,which can also deal with Li-ion battery packs . It supports NiCads and NiMHs from 1.2 to 14.4 V in 1.2V increments and Li-Ion batteries from 3.6 to 14.4 V in 3.6 V increments . It is fully automatic and accommodates any size of pack in the above voltage ranges.
Although the unit with its SMPU (to suit 80 -240 V -50/60 Hz) and cigarette lighter adapter (for use in a car) costs US$ 90.- , the pay back is obvious.
When I bought the earlier model MH-C777 , I also bought a new NiMH pack for an ICOM HT since the old NiCad pack no longer accepted charge from the ICOM supplied (simple) charger. But surprise...surprise ,that (9 years)old pack has been 'revived' with the charger and is still in use , be it with a somewhat reduced capacity.
I now also have the MH-C777Plus which is also used (from time to time) to charge the 7.2 V Li-ion pack for my Nokia 8110 mobile phone.
Smart technology .....go for it !

Frank gm0csz.kn6wh@ntlworld.com

PS : No commercial connections with MAHA Energy , just a satisfied customer.

Not sure if we have a slight difference in terminology here, Roy.

The normal protection board provides overvoltage and undervoltage
protection via series (usually FET) switches. Additionally,
protection against overcurrent (on discharge) is usually provided
either via a fuse or the series switch.

Better protection boards provide cell voltage differential sensing and
shutdown if individual cells differ by more than a certain amount.

There is often a thermistor to provide the charging circuit with pack
temp info, usually facilitating charge suspension if pack temp is
outside +5 - +45C.

With all the above connections to a series string to a (nom) 10.8 volt
pack, most laptop manufacturers and other OEM Li_Ion consumers elect
to place the charger on the laptop itself.

One instance, AcerNote Lite 370 series (P133/P150) - of which I own
two - are spec'd to use either Li-Ion or NiMH packs. Although in this
case the placement of the charger cct on the pack would be more
logical, the cct is in fact in the laptop, and the interface connector
determines which charging regime is employed.

None of which means that ALL manufacturers see the world that way :-)

I have some possible solutions for this
You can stabilize a free running oscillator with a phase locked loop. In my case I have a "huff and puff" design which uses a microcontroller to count and dsiplay the frequency (with user settable offsets if required). The controller also generates an error voltage to keep the loop locked and stabilize the VFO. The loop will work within a range of +/- 2.5 KHz or so. Beyond this the loop loses lock - but a reasonable VFO should stay within this range!! When the VFO is tuned the loop unlocks and locks again when the VFO is stable. I have used this circuit for a triband SSB rig on 7/14/18 MHz successfully
Alternatively I have a quadrature DDS board with controller board also using the AD9854 which could be used to generate the local oscillator signal with 0 and 90 degree RF signals accurately generated. In theory at least phase spurs might be a problem but they are better than -50dBc worst case. I dont know how it is in practice. The board has software for rotary encoder or keypad tuning or sweep modes etc from about 10 Hz to 65 MHz or so in 1 Hz steps. I have boards available via Paypal

See http://www.iinet.net.au/~richardh/VK6BRO.htm

I have looked all over the place and having a hard time find this information, so any feedback would be appreciated:

Can a reading at uV be converted directly to uV/m? The same would go for dBmV, dBuV, dBm , dB, can reading taking at any one of these unit be converted directly to uV/m?

Thanks

Something we did when I was in a similar situation was use the metal
building as the antenna. In my case it was a lot bigger building, but we
just tied the antenna input to one of the sheet metal screws holding the
metal panels together. And in our case we had even noisier vapor lamps up at
30 feet. Our building wasn't directly grounded at all locations, so if your
building has mutiple grounds it may act more as a ground plane than an
antenna.
thanks, John.

>be converted directly to uV/m?

The answer, for the most part, is yes.

uV is an absolute measurement. uV/m is simply the uV divided by the wavelength in meters of the measured signal. dB is an expression of ratio over a fixed level, therefore you need to know what the base reference is before you can convert that measurement to uV. dBmV, dBuV, and dBm are dB above or below their specific reference at a defined impedence. dBmV is referenced to 1mV at 75 ohms. dBuV is referenced to (I believe) 1uV (And, as I recall, could have one of several reference impedences), and dBm is referenced to 1 milliwatt at 50 ohms.

Once you know the reference, you can determine the representative value and thus convert it to uV.

I've opened the pack for my Toshiba Portege, and it has a series string
of three groups of two parallel cells. There are connections to each
node, a thermal fuse for each group of two cells, a temperature sensor,
and a circuit board with two chips, seven smt transistors, and several
chip capacitors and resistors. The connector that plugs into the
computer has plus and ground for the power to the computer, plus eight
other connections. There's enough there that I'm pretty sure the unit
reports its status to the computer, including when to shut down.
But the cells themselves could easily be replaced if I could just get
new ones somewhere.

> that's because the output is a mix of frequencies.

(Thanks for all the other stuff you wrote, too...just saving some
space here, but maybe someone else will see something in there that
triggers another idea they can share with you.)

The 21.4MHz is a bit puzzling! If you have enough signal to see
there, I'd expect it to be mostly the LO frequency, the RF input
frequency, and the difference and sum. I assume there's a tuned
circuit on the mixer output that should be fairly sharply tuned to
10.7MHz, though, so that's mostly what I'd expect to see. Do you have
any way to actually measure the LO frequency and verify that it's
10.7MHz from the desired RF input freq?

Another suggestion: is there anyone around where you are that you
could get to give you a hand? I often find that even if the person
doesn't fully understand what I'm trying to do, just having to explain
it to them will give me more ideas to try, and if they ask questions,
so much the better. Of course, if you're lucky enough to find someone
who actually has worked with similar circuits and knows them inside
out, that's even better. (You might mention where you are...some
lurker might pop up and offer to help in person.)

In any event, it sounds like you're learning a lot! I can remember
back to a few frustrating things like that, and looking back on them,
realize I learned things that I didn't fully appreciate at the time.
That is, I didn't even realize I'd learned them, till I saw something
similar years later and suddenly realized what it was that I'd seen
the first time, and what it all meant.

Cheers,
Tom

SAM wrote:
> uV/m is simply the uV divided by the wavelength
> in meters of the measured signal.

Not even close. Description of a microvolt per meter from an old post by
Richard Harrison:

It is derived from the power radiated from a point source and the
geometry of a sphere. At any distance from the source, the power flowing
through the surface area of a square meter of the sphere surrounding the
point source is defined. The sum of all the incremental powers in the
total square meters of the sphere must add up to the radiated power.

The voltage per meter is related to the power per square meter by the
characteristic impedance of space which is 377 ohms.

Note that wavelength never enters into it.

Sure, at least for a test. If nothing else it would tell you whether lots of extra IF bandwidth is needed; FM broadcast radio IFs have to be pretty wide, compared to most communications FM IFs. You might even get *lucky* and find out it works better than the kit with a little output filtering.

> Also, something that's REALLY bugging me, and forgive me if it's a
> rather silly question. But what determines if it's going to be high-side
> injection or low-side?

The design engineer. :) And, of course, other considerations. For example, think of an AM BCB receiver. For low injection, the LO would be 105 KHz to receive a 560 KHz signal (with a 455 KHz IF)... definitely less practical than high injection at 1015 KHz, if only because of the size of the LO coil.

> Seems the receiver is just RFin --> NE602 (with

> be high-side or low-side injection. Does mixer say, "Ok Mr. RF in, you
> have to be 10.7Mhz lower than my LO or else!" ?

The mixer mixes ALL input frequencies with the LO and produces a whole lot of output frequencies. By filtering so that only 10.7 MHz comes out, you ensure that only input frequencies that are 10.7 MHz away from the LO frequency are left. The mixer doesn't care whether the LO is higher or lower, but you might. Suppose you wanted a simple receiver for 123.75 MHz and a 10.7 MHz IF, and a kilowatt repeater at 145.15 MHz a mile away. If you make the LO 134.45 MHz, you'll get both the signal you want, and the repeater. Then again, if you make the LO 113.05 MHz and you have a strong FM BC signal at 102.3 MHz, you're in trouble the same way, but from a different source.

> I was messing around with diffeernt 10.7Mhz filters and put what I think
> is the original back in, but still a poopy looking satellite image -- no
> grays. So I'm wondering if the 10.7 filter I have in there is the right
> one; have tried many others.

Maybe they're all poopy *for your purposes*. What matters is how wide they are, i.e. how wide a band of frequencies gets through. Too narrow, and you can distort the signal badly. Too wide, and you get other problems. If

indeed they're all poopy, they're probably all too narrow. How wide are
the satellite signals supposed to be?

Have found several sites on internet where my mods are described with reference to figures, but the figures are totally missed, so I just wonder what sort of persons are providing the sites? Wonder if they do know what a circuit diagram (schematic) is?

you may search with google for la8ak and get 150 hits, so it shouldnt be necessary to quote any of the sites

Because all Lithium chemistries include the capability for mischief (smoke, fire, flame, bursting, explosion), their manufacturers are *extremely* loathe to sell them to anyone besides well proven original equipment manufacturers (OEMs) who package them with the protection circuitry and enclosures that have been well described here. I ran into that in designing the fiber-to-the-home backup power capability for a former employer (a major telecom company). Turns out NEC, Matsushita / Panasonic, and so on were very interested in our business but none of them wanted to sell us the cells themselves for just that reason. Rather, they refered us to third party companies that incorporated the cells into packs which we would then use.

Combine that with the limited number of sales of such packs, that they are sold afterwards much like car parts (if you made a car from separately purchased parts it would cost an order of magnitude more than the complete car), and that limited supply of manufacturers for a given pack, the high pack prices are no suprise.

I've been tempted to replace the 16450 series cells in my now-nearly-dead NEC4000C's pack with NiMH cells. They wouldn't store nearly as much but they'd do much better than the now-dead cells, should last a long time, and would cost a fraction of the $169 for a "discounted" pack. Of course, the protection circuit would need revising.

Best of luck with your search!

Jim Horn, WB9SYN/6

139.2625 what? MegaHertz? (I smell cable tv) Divide that number into
300 and you will get the wavelength in meters. 2.154 meters wavelength
in this case.

7887. Re: Convert Reading

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-22 01:37:17 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <3C23E3CD.9780C692@eznec.com>
Source record: 47884

A radio wave travels through space at the speed of light. The fields change amplitude and direction in a periodic manner, the period being the inverse of the frequency. The fields from a 139.2625 MHz signal go through a complete cycle every 1/139,262,500 of a second, or about every 7 ns. The wavelength is the distance the wave travels during one of these cycles. If you think of a radio wave as being like an ocean wave, the wavelength (which you'll hear reported on your weather radio for the ocean waves) is the distance from one peak to the next, or one trough to the next. Remember from high school, or maybe junior high, the formula Rate X Time = Distance? To calculate the wavelength, which is the distance from one cycle to the next, the rate is the speed of light, or about 300,000,000 meters per second, and the time is the period of the wave, or 1/frequency. So the wavelength of a 139.2625 MHz signal = 300,000,000 * 1/139,262,500 = 300,000,000/139,262,500 = about 2.15 meters. 2.15 is approximately the wavelength in meters of a 139.2625 MHz wave in the air or space.

The speed that light, and therefore a radio wave, travels depends on the material it's moving through. It travels the fastest through a vacuum. So if the radio wave is moving through any material except space, the speed will be slower than 300,000,000 meters/second and the wavelength will be correspondingly greater. For nearly all practical purposes, the speed through air is the same as through space.

On this receiver, the mixer's output (where I'm seeing this 21.4Mhz signal) is shot through the ceramic filter from which its output goes to Ramsey's poor excuse for an IF amp (single transistor, couple 'o' resistors), then it's AC coupled to the 3359. I cracked open a Sony FM receiver (dual-conversion, surprising!) and scoped its IF circuits, etc. Nice signals! Allowed me to do a comparison test.

We have a ham club here in Eugene (OR). Last time I went was a few years ago, I seemed to click with the folks there. But, I thought I'd post to the newsgroup first given the greater population and borader knowledge base. I won't go w/out saying that I DO appreciate everyone's help. Like I said, I posted my first query to another newsgroup and got nothing. Then I figured I'd try a ham group; didn't let me down =)

I tried that with a couple of receivers and didn't get good results.
Looking at these receivers, they run the output of the IF filter
directly to the chip; as opposed to Ramsey who amplifies it. Before I
did, I scoped the donor radio's circuits and found the 10.7Mhz IF input
on the iC, so I knew where to insert the signal from Ramsey's receiver.

> from a different source.

Alrighty, I get it now. I was kind of under the impression that you do
get a whole slew of freqs. at the mixer output (which was the right
impression). Then it's a matter of selecting (and filtering) which
frequency you want.

> Maybe they're all poopy *for your purposes*. What matters is how wide they

> the satellite signals supposed to be?

"They" say you need roughly 40kHz bandwidth. The 450kHz filter I have is
a Murata 450B, B I believe denotes the bandwidth (as opposed to "D" at
15kHz) at 20-25kHz. I found a webpage once that had a list of the
bandwidth suffixes so those values are from memory. I haven't touched
the 2nd IF filter as it hasn't given me any problems (yet). Keep in mind
that I WAS receiving the satellite signals quite nicely at one time. So,
either I inadvertenly burnt something up (I do it occasionaly) or
there's something else going on.

I do appreciate the explanations and suggestions. I'll try some more
"run-the-IF-to-another-receiver" experiments and see what that reveals.

Well, yeah. Even if you filter well (e.g. tuned RF), you can have lots of
unwanted frequencies going into the mixer. IF you could put precisely one
pure input frequency and one pure LO into a mixer, you should get four
frequencies out; but that may not happen all that often.

Some further checking is in order. Sounds like even your wide filter is
a bit too narrow, given the data you supply. IfIGetAChance I'll dig a bit
and see what's supposed to be what.

> I do appreciate the explanations and suggestions. I'll try some more

>Not even close. Description of a microvolt per meter from an old post by
>Richard Harrison:

Well, I don't know who Mr. Harrison is, and I don't know the context of his description, but in the context that I believe this person's post was based the answer is correct. Call the FCC's Cable Television engineering department and ask for the definition of uV/m and they will tell you exactly what I stated.

From multiple broadcast and cable television references:

to convert uV/m to uV
(microvolts per meter) / .021xFMhz

to convert uV/m to dBmV
20log * microvolt per meter / 21*FMHz

to convert dBmV to dBm add 48.75

I'm with Clifton about the filter maybe being too narrow (though that
doesn't explain why you got okay reception first, and then not so good).

I haven't paid complete attention, but weather satellite receivers
have to deal with doppler shift, so that's one reason why a wider
bandwidth would be desired. I think the deviation is wider than
the usual two-way deviation, but I'm not certain.

So you want a filter that is wider, and certainly I've read comments
about that. Chances are pretty good that your stock filter is not
wide enough, since it would be intended for the usual deviation.
It's not like you will get wider 455Khz ceramic filters for less,
actually they're likely to be more costly since they will not be
used in as many places, so they are not likely to put a wider filter
in a receiver intended for voice communication.

Your concern about the 10.7MHz filter is probably the reverse, however.
As long as it's one of those small ceramic, brown three-legged filter,
most likely it is more than wide enough. Those probably have come out
of FM broadcast useage, cheap and easy to get ahold of, and hence will
be something like 280KHz wide. That filter in this case (and in
the case of many dual conversion narrow band FM receivers) is there
not for receiver selectivity but to make sure that only the 10.7MHz
product out of the mixer is passed onto the rest of the receiver.
You get a good filter, albeit wide, and it requires no adjustment.

Even if the 10.7MHz ceramic filter (so long as it is a ceramic filter)
isn't 280KHz wide, it will be wider than you will need for weather
satellite reception.

And if I recall properly, the colored dot has nothing to do with
the bandwidth, but comes from a sorting process that finds the center
frequency; like 10.7 versus 10.75MHz or whatever.

So any bandwidth problem would rest in the 455KHz filter. I saw one article once where the author bypassed the filter with a capacitor, thus making the receiver rely on the 10.7MHz filter for it's selectivity. That might make things a bit too wide.

From time to time, people suggest using an FM broadcast receiver for weather satellite reception. That gets the bandwidth too wide for optimum reception. And since they are designed for a wideband deviation, the narrower deviation of the satellite may result in low recovered audio.

Exactly. The stock reciever did fine with the satellites. Since I've had the receiver, I've made lots of changes and have since gone back to pure stock.

Actually, my receiver uses a 450kHz 2nd IF. Unless the satellites have changed, I shouldn't have to change that filter. Things were working find with it.

Well, after a bit of experimentation and scoping different radios, I've come to the conclusion that either the SA602 is flakey or it's something further upstream, like the quad. detector. I've been trying all kinds of 10.7Mhz filters with varied results. When I tried one filter, the

amplitude of the wave going into the 3359 was much better. And I noticed the AFC circuit seemed to track the signal better as I made changes to the quad. coil.

Yes, I'm quite aware of this. The bandwidth is sometimes (based on my "research") indicated by suffixes. One thing I do know is that 10.7Mhz with a red dot is centered on 10.7Mhz, while orange is on 10.73Mhz. Even that small of deviation affected the receivers performance.

I tried that for the heck of it to see what I would get. Unfortunately, the satellites only fly overhead twice a day so whatever changes I make, I have to wait. The cap didn't do anything (.01uF) really, I still had the same ugly pictures.

Need the circuit diagram showing automatic threshold control for RTTY,
but cannot find my old magazines showing the simple circuit using 4
diodes and an op-amp (Squarer)

could somebody guide me to an URL showing this?

73,
Jan-Martin

Have you looked at www.rtty.com in their files ? If the ST-6 is there
you should be able to take it from the circuit.

AMATEUR RADIO NEWSLINE(tm) REPORT #1271 - DEC 21, 2001

Amateur Radio Newsline report number 1271 with a release date of Friday, December 21st, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T. A national ham radio society is asked to train new hams for government service. This story is first on this weeks Amateur Radio Newsline report number 1271 coming your way right now.

(Billboard Cart Here)

**

THE EDUCATION SCENE: HAM TRAINING LEADS TO SA GOVERNMENT JOBS

A government agency has asked a national ham radio society to help train new hams. The reason. careers with that agency. Its happened in South Africa as we hear from Q-News Graham Kemp, VK4BB:

--

In South Africa, their Department of Communications contacted the SARL with the request to train seventeen post graduate students as amateur radio operators. These students had already qualified in different fields, some technical and some in the Information Technology fields. There were nine ladies and eight men. From next year they will be employed by the Department of Communications, and the idea was to give them some experience in the field of radio communications.

Training was done by Henry Chamberlain, ZS1AAZ, over a period of one full month. In addition to lectures, the students could see practical demonstrations of amateur radio and they spent one period building and testing a Morse Code practice oscillator. They also visited ZS1AAZ's home shack. The seventeen students had already proved their ability by passing their previous studies successfully. It was therefore no surprise that they ALL passed the amateur examination.

For the Amateur Radio Newsline, I’m Graham Kemp. VK4BB, of Q-News.

--

The seventeen will be assigned specific jobs with the South African Department of Communications in early 2002. (SARL, Q-News)

**

SPECTRUM SHARING: FCC SAYS YES TO HIGHER POWER UNLICENSED TRANSMITTERS AT 2.4 GHZ

The FCC has approved issued new rules permitting certain unlicensed Part 15 devices operating between 2405 and 2450 MHz to use higher power, but under significant restrictions. The band is allocated to amateurs on a co-secondary basis. Amateur Radio Newsline's Norm Seeley, KI7UP, takes a look at the FCC action:

--
According to the C-Q Magazine website, the decision was adopted on December 11Th. In it, the FCC approved a petition by Sierra Digital Communications, Inc. to permit unlicensed fixed point-to-point transmitters in the band to operate at field strengths of up to 2500 millivolts per meter. This is a tenfold increase over past power limitations.

Sierra Digital Communications manufactures and sells equipment for wireless data communications, including high-speed wireless computer networks and Internet links. The ARRL had opposed Sierra's petition on the basis of increased risk of interference to amateur and amateur satellite operations. This is because the downlink from the AO-40 satellite is in the 24 GHz band.

But the FCC said it believed the restrictions it is imposing on the higher-power transmitters will provide sufficient protection to other users. This includes industrial/scientific/medical equipment, radar and Earth exploration satellites, in addition to amateur radio. The new rules require highly directional antennas and high frequency stability of transmitters.

For the Amateur Radio Newsline, I'm Norm Seeley, KI7UP.

--

In its decision, the FCC singled out an ARRL comment where the League clamed that Part 15 devices are permitted by the Communications Act of 1934 only where they have no interference potential to licensed services. The Commission called the League's interpretation of the law overly conservative. It said that its rulings to date appropriately provide a means for allowing unlicensed devices to share spectrum with licensed services with little risk of interference and adequate protection to licensed service. (CQ)

**

HAM RADIO AND THE WAR: MARS ON THE AIR FROM THE WAR ON TERROR

Ham radio is making it possible for those fighting the war against terrorism to phone home. This as the ARRL Letter announces that Army Special Forces on duty in Islamabad, Pakistan, and in other undisclosed locations have begun keeping in touch with home via MARS -- the Military Affiliate Radio System.

Phone patches provided by the Military Affiliate Radio System make it possible for troops to call their families in the US from areas where commercial communications channels are not available. Amateur Radio operators enrolled in MARS provide the connection between the Military Affiliate Radio System stations deployed overseas and the telephone system back home.

During the Vietnam War, phone patches were a major source of comfort to families and service members alike. MARS also responded during Operation Desert Storm. (ARRL)

**

BREAK 1

Wishing you a Happy Holiday from the United States of America, we are the Amateur Radio Newsline, heard on bulletin stations around the world, including the Great South Bay Amateur Radio Club repeater, W2GSB, serving West Babylon New York.

(5 Sec Pause Here)

**

HAM RADIO AND THE WAR: GODDARD ARC FEELS THE PINCH

The Goddard Amateur Radio Club says that it has been having serious problems with manpower lately and the war on terrorism is partly to blame. This is because new security restrictions imposed after September 11th require all visitors to Goddard to be escorted by a badged employee at all times.

According to Dan Schultz, N8FGV writing to the Amsat Bulletin Board, the clubs WA3NAN ham shack is located on government property we are bound by the new restrictions. This says Schultz makes it much harder to bring in control operators who are not Goddard employees. As a result, WA3NAN which for years has been the primary rebroadcaster of shuttle communications on the ham bands is not there as often as it would like to be.

Schultz also notes that the Goddard Amateur Radio Club currently has no president because no one has stepped forward to accept the job. The position of Shuttle Retransmission Director is also vacant, this is the person who makes the phone calls to get operators lined up to pull shifts at the retransmission facility.

Schultz says that the long term technical solution will be to automate the station with remote controls and telemetry for the transmitters so that the retransmission operator can operate from his home. But adds N8FGV, but that is still a little ways off in the future. As a result, WA3NAN is not there as much as it used to be. (AMSAT-BB)

**

AMERICA AT WAR: NEW HOMELAND TERRORIST ALERT SYSTEM PROPOSED

Homeland security chief Tom Ridge is considering a multistage system for terrorism alerts. Ridge is also weighing how to reimburse states for the costs of increased security since the terror attacks.

Since the September 11th terrorist attacks on New York and Washington, Ridge has issued three general warnings. None of the alerts identified specific targets.

Now, according to news reports, Ridge will propose a four-stage Threat Alert Network similar to the military's DEFCON'' system. DEFCON alerts military personnel to the seriousness of a threat. A private sector version would be aimed at helping state and local law enforcement personnel determine the level to react to a Federal government issued terror warning.

The proposal came to light after California Governor Gray Davis met with Ridge about a week and a half ago. Davis told Ridge he had proposed such a similar system for California, and said Ridge had asked him to wait pending a national model. Ridge told Davis that he hopes to unveil the national system by January 15th of 2002. Whether or not ham radio will play any part in such an alert system is not known as we go to air. (Published news reports)

**

AMERICA AT WAR: CONFERENCE HELD ON ALERTING THE PUBLIC

Still in there area of alerting the public, more than 120 leaders from the emergency warning community met November 30th and unanimously called for the creation of a public-private partnership. This, aimed at improving the delivery of timely and accurate emergency information to people at risk. Don Wilbanks, KC5MFA reports:

--

The group came together at a special conference arranged by the National Warning Organizing Committee. This is a group of emergency warning advocates representing the public and private sectors.

Those attending included federal, state and local government officials, not-for-profit organizations, and representatives from the private sector. And in the end the group has tasked itself to improve the delivery of warnings and emergency information to the public. This, through better education, research, standards creation and policy recommendations.

The Committee Chairman is David Liebersbach, Director of the Alaska Division of Emergency Services. He has appointed Peter Ward, formerly of the U.S. Geological Survey and chair of a White House-appointed working group on natural disaster information systems, to head up a committee to determine the new organization's structure and governance. Ward also serves as the new organization's spokesman. More news on the work of this committee as information is released.

For the Amateur Radio Newsline, Don Wilbanks, KC5MFA, in New Orleans.

--

The conference was hosted by The MITRE Corporation in McLean, Va. MITRE is a not-for-profit national technology resource that provides systems engineering, research and development, and information technology support to the government. (MITRE)

**

HAM RADIO AND EDUCATION: HAM RADIO MASS BALLOON LAUNCH

The Timberlane Regional High School, in Plaistow New Hampshire will be taking part in a high altitude experiment next spring. This with an announcement that the Coordinated Algebra II and Physics classes taught by Lorainne Mascioli, N1VYQ, and Lou Broad, N1RCA, are planning thier third year of ham radio and high altitude balloons in May of 2002.

Six student teams will attempt to launch their balloons at the Hosstraders Ham Fest at the Hopkington Fair Grounds in New Hampshire. Each team is responsible for design, construction, and operation of their system. Each balloon will carry a GPS receiver, a packet reporting system and several experimental payloads. This could include cameras, video, amateur television and cross band repeaters. At maximum altitude such systems will have a range of 300 miles and should easily cover all of New England and more.

The class has grown to 34 students and they are planning to launch six balloons in a two day period! This could make it a record breaking event in both ham radio and high altitude ballooning. For more information check out the CAPSAT Website located in cyberspace at
http://www.mv.com/ipusers/llb/capsat.html (Via Internet)

**

HAM RADIO SPOTLIGHTED IN POUGHKEEPSIE JOURNAL

New York’s Poughkeepsie Journal has highlighted ham radio in a December 6th front page article. The piece focused on the public service aspects ham radio with quotes and pictures.

According to Andrew Schmidt, N2FTR, who is an ARRL Assistant Director in the League’s Hudson Division, many Poughkeepsie area local hams spent time at Ground Zero or at the Red Cross centers in the greater NYC area following the September 12th terrorist attacks. Andrew says that their work is well highlighted in the article. The link is:
http://www.poughkeepsiejournal.com/thursday/community/stories/co120601s12.
shtml. (Via Internet)

A SPECIAL AM EVENT: THE HEAVY METAL RALLYE

This is Paul Courson WA3VJB with news of an operating event Saturday night, December 22nd. It's the Heavy Metal Rally, featuring big iron, vacuum tubes, and the warm and inviting sound of AM on the shortwave ham bands.

Starting around local sunset listen for rigs in the 250 watt or 250 pound category to populate AM gathering points on 160, 75 and 40 meters.

Jim, W8MAQ was testing HIS 1947 Collins 300-G a few days ahead of the Heavy Metal Rally. The retired broadcast transmitter re-tuned to 75 meters sounded like this:

In-Q: it's been great to get on... 300-G..
Out-Q: forward to that

--

Prizes include a trophy, pictured as a posting on QRZ.com, for the best sounding station.

Last year more than a hundred stations took part -- and the winner was Mike, WN3B, on a Gates 250-C. He gave Jim an audio report the other night:

--
In-Q: It's got more highs....
Out-Q: Shure 55
--

The Heavy Metal Rally is sponsored by Electric Radio, a magazine featuring vintage ham radio, and published by Barry N6CSW. The event was pioneered by Bill, KD0HG of Colorado, a broadcast engineer with a knack for big homebrew rigs that sound great.

Frequencies and a website are listed on the news page of QRZ.com.
Paul Courson, WA3VJB, Annapolis Maryland.

**

HAM RADIO HISTORY: COLLINS RADIO CENTER NOW OPEN

The new Collins Radio Center which is the headquarters for the Collins Radio Association is now officially open for guests and visitors. Located near Johnstown, Pennsylvania, the Collins Radio Center includes a representative collection of Collins radio equipment, from the 1930's to the present. There are other classic and antique radios on display as well. More information is on the web at www.collinsra.com. (Collins RA Press release)

**

HAM RADIO BUSINESS: CITY ELECTRONICS - RIP

Alex Stalinsky, WA5UHT, who owns City Electronics, a small parts outlet in Houston for almost 50 years, has decided to call it quits. According to Chris Boone, WB5ITT, this place was one of the main sources of parts, components in Houston long before the likes of Mouser and Digikey took off in mail order sales.

Chris tell Amateur Radio Newsline that he bought many parts from City Electronics in his early days of repeater building. In fact, Chris says his mother claimed that he owned half of the local Radio Shack but she was wrong. It was really like he was a part of City Electronics as were many other young Houston area hams and Chris tells Amateur Radio Newsline, it will be missed. (WB5ITT)

**

EMERGING TECHNOLOGY: INTELS NEW WARP SPEED CHIP

In another step toward faster computers, Intel Corp. has developed two new technologies that will help the tiny transistors inside microprocessors run cooler, use less power and operate more efficiently. The new designs

complement several recent breakthroughs in building minuscule transistors that form the basis of all modern computing as they switch on and off billions of times a second. Earlier this year, Intel unveiled transistors just 20 nanometers wide. Today's Pentium 4 has 42 million transistors, each about 180 nanometers. For reference, a manometer is about 10,000 times narrower than a human hair. (Intel)

**

EMERGING TECHNOLOGY: DTV ROLLOUT UPDATE

Roughly two-thirds of commercial television stations plan to broadcast a digital signal by a federal government deadline of May 1, 2002. This, according to the National Association of Broadcasters.

In a report to the Federal Communications Commission, the industry group said that many of those that won't make the deadline are waiting for equipment to be delivered and expect to have digital broadcasts on the air in the months afterward. But some stations in smaller markets are having a hard time paying for the upgrade, the association says.

Right now, most home television sets in use receive only analog signals. But congress has mandated that broadcasters must give up their analog channels to the government by 2006. As a result, there are concerns that consumers won't have made the costly upgrade to televisions that can receive digital signals by that date. (Broadcasting Daily)

**

HAM RADIO IN SPACE: EXPEDITION 4 CREW NOW ON THE ISS

An all ham crew is now in charge of the International Space Station and will be for the next six months.

Three astronauts and cosmonauts now running the ISS. They are Russian Commander Yuri Onufrienko, RK3DUO, along with American Flight Engineers Dan Bursch, KD5PNU, and Carl Walz, KC5TIE. They make up what is called the Expedition 4 crew and all three are expected to be on the air regularly for school contacts and possible open QSO times made available to talk with hams worldwide, as time permits.

The Expedition 3 crew comprised of United States Commander Frank Culbertson, KD5OPQ, along with Russian Flight Specialists Mikhal Tyurin and Vladimir Dezhurov is now back on good old Mother Earth. They returned on Monday, December the 17th aboard the space shuttle Endeavour. (AMSAT-NA, ARISS)

**

HAM RADIO IN SPACE: EDUCATIONAL ASSISTANCE FROM VK5ZAI

Attention educators. If you are thinking about teaching the International Space Station, here is a bit of assistance.

Tony Hutchison, VK5ZAI has updated his web pages with links to help schools in obtaining educational programs associated with the I-S-S and space science in

general. Hutchison says that this should be of interest students and teachers alike especially if they are contemplating applying for a ham radio contact with the astronauts on the station.

Hutchison is the Australian ARISS Coordinator. His website in cyberspace at www.electric-web.org (VK5ZAI)

**

SPACE AND SCIENCE: CHINA ON THE BRINK

Space Daily reports that China is getting ready to launch its third unmanned spaceship. This, to pave the way for sending that nations first astronaut into space sometime next year. China is reportedly also in final testing and preparation to launch a new satellite dedicated to study ocean colors and related phenomena. (Space Dailey)

**

DX

In DX, 9V1YC reports that he and eleven other hams will be activating South Georgia and South Sandwich Islands in January and February of 2002. The operation will be strictly on the high frequency bands. Exact dates, call signs and QSL managers are not being made public until the group is actually on the air. The New Zealand registered vessel "Braveheart" of ZL9CI fame will be supporting this team for the entire 30 day trip. (RSGB)

A bit higher in frequency, Jeff Klein, K1TEO reports that December 6th was another great D-X day on the 6 meter band. Jeff who lives in Connecticut says over the VHFReflector that the band was open for a solid two hours beginning at 7:30 am local. And talk about D-X. On his very first C-Q he landed HB9QQ who was operating portable HB0. Even better, Jeff says that the fifth caller was 4X1RF. (VHF Reflector)

Over in Great Britain hams are actually D-Xing for charity. Jeramy Boot G4NJH, reports from Nottingham in the U-K.

--

Every year in September, the British Wireless Fund for the Blind -- a registered charity - organises a fund-raising event in which amateur radio clubs and individuals are sponsored for the number and distance of the contacts that they make. As of the 11th of December, the British Wireless for the Blind Fund reported that 'Transmission 2001' had raised £6681.48, with more coming in every day. They say that they hope the final total will reach £7000. The charity offers prizes to the club and individual raising the greatest amounts.

This year the Cray Valley Radio Society operating as GB2FB and taking part for the first time, won the prizes for the club raising the most money and for making the most contacts. Robert Guscott, M5GUS, operating as GB0WB, won the prize for the leading individual.

Jeramy Boot, G4NJH.

--

The bottom line. This is another way that hams can not only enjoy their hobby, but can help others at the same time. (G4NJH)

**

THAT FINAL ITEM: A HAM RADIO CHRISTMAS STORY

And finally this week, the story that we wait all year to tell you. Its the ongoing story of hams who care about hospitalized children and what they do to bring a bit of holiday cheer to those kids who cannot make it to the mall to spend a few moments with old Saint Nick. Here’s Amateur Radio Newsline’s Joe Moell, K0OV:

--

As most hams know, propagation is very good this time of year. It's so good that it's easy to make contact with the North Pole. Many clubs around the country are taking advantage of these propagation conditions to set up QSOs with a very special North Pole station. They're making these contacts from hospitals and rehabilitation centers, and they sound like this:

--
Santa and Kids Audio Here
--

That's what the North Pole Network sounds like in southern California, where it's celebrating its 25th anniversary at Childrens Hospital of Orange County. In the past few days, I've heard from other clubs in the North Pole Network, including the AkSarBen ARC in Omaha and the Southwest Missouri ARC in Springfield. And YOUR club could bring holiday joy to hospital patients. There's a how-to article on the subject, with a dozen suggestions for your best North Pole Network ever, currently running on ARRL's Web site. That's arrl.org, of course. And there's even more about North Pole Network in southern California, plus lots of photos showing a quarter century of holiday fun, at the Hospital Disaster Support Communications System Web site, www.hdscs.org. Check it out, and start planning for your own North Pole Network joy.

Generally speaking, microvolts per meter is a referance of a radiated
signal at some distance away from the radiating source (antenna), and
so you can't convert without knowing antenna characteristics.

What is it exactly you want to find out?

Don't worry about it. Changing from 50 to 75 Ohms only creates an SWR of 1.5. If everything else is good, that's not too high. However, the great length of that feeder is of some concern. Verticals aren't very good antennas as it is so you may be disappointed.

Presuming that the HV transformer is to be used to produce HT/B+ for tube equipment, say a transmitter, would it not be possible to use the transformer with one end grounded i.e. attached to the metal chassis, as it is in a microwave oven? Then using a half wave rectification it should be possible to get somewhere around the secondary voltage x 0.707 volts (say 1600 to 1700 volts) DC of B+.
OR: Use two such transformers (heavy though) in a more conventional full wave circuit; the 'centre tap' being the grounded ends of the two secondaries, connected to chassis or the HT negative or B minus rail?
The primaries would need to be 'phased' correctly.
Gee whiz, even with one such transformer, a couple of thousand volts at say 300 milliamp is 600 watts!
DANGEROUS too! Keep those hands in a pocket!
In original microwave oven rectifying circuits that I have so far encountered, one end of the transformer HV secondary is 'grounded'; the positive IIRC because of the magnetron, not that it matters that much for what is being discussed here?
There are other rectifying configurations including voltage doublers etc. that might be used?
BTW. Those original rectifiers in microwave ovens must be able to handle the power required also? i.e. pulsed DC to operate the magnetron. The capacitor is often around 0.8 mfds. at several Kv.
Also wonder if it would be better to use 'choke input' filtering (again presuming the use of the High Voltage to produce filtered DC to operate tube electronic equipment) if such rectifiers are used and/or check the inrush current limitation. Also any DC choke resistance in the B+ line

(I guess chokes would have to be in the B+ line, in this instance, with a grounded transfomer? Unless unusual configurations were used!
I've saved a couple of such transformers from 1000 watt ovens (115 volts) that the owners do not want fixed. New units are so cheap now! They do look pretty sturdy and capable of operating in say intermittent amateur service. After all some microwave settings are for continuous cooking for 40 or 50 minutes or longer! Haven't seen a burnt transformer. Several magnetrons, yes.
We have five domestic, not commercial, microwave ovens in a school cafeteria business that operate semi continuously for much of the lunch period, daily; I would reckon at least 60% 'on', maybe higher, for one half hour; they get hot but none have blown a transformer; yet!
Couple of ideas. Terry.

Source record: 47804

Scott,

I will bet that it is a hard value to find...

Your best bet is to buy a 38 MHz crystal, build an oscillator, and divide it by 1000 and then by 2 with digital logic and then add a little filter to make a sinusoidal wave. If you need help with this circuit, drop me an E-mail.

Feed this into one leg or the other where the missing crystal is.

Having not seen the schematic of the generator, I cannot guarantee this will work, but it likely will.

Mouser Electronics sells a 38.00053MHz crystal (close enough) for $0.80 and they have no minimum order.

Clyde

I really cant thank everyone enough for these replies, I am able to take a reading at uv/m and convert it properly to uv with the feed back from Sam. What I am trying to do is create a small calculator to calculate and reading in uV/M and convert it to what it would be equal to at a different freq and distance. Example:

A reading of 30uV/m at 139.2625MHz taken at 30ft from source is equal to 16.7652 dB at 121.2625 and a distance of 10 ft.

I feel it is a good tool for those taking the measurements because now they will become more aware of what a reading maybe and not stupid like myself who always had testequipment do it for me!!!!!!!!

Bob is right about the length of coax being a problem. I disagree about verticals not being very good antennas. They can be GREAT antennas, although often they are not.

First and foremost, depending on the particular vertical and the type of ground at your QTH, you may need an extensive ground system for the vertical to work well. If all that 75 ohm coax is vertical, then it may not be much of an issue assuming that the vertical you are installing has adequate radials.

Now, the really important part. When you install the antenna, there will presumably be some sort of adjustment. Coax loss at HF isn't too bad, although at the higher HF region, where you intend to operate, it starts to be a problem. The effect of the coax loss is magnified by SWR.

If you want this antenna to work reasonably well, you will need to carefully adjust it by reading the SWR *AT THE ANTENNA*. The SWR at the end of your feedline will at best be misleading, at worst totally irrelevant. Ideally, you want the antenna to be installed in it's final place when you do this. In a more "normal" installation this adjustment wouldn't be so critical, but with 225' of coax at 12 meters, the coax loss will not be insignificant, and it will be magnified by the SWR. It's this coax loss that makes the SWR reading in the shack not very meaningful.

I worry a little about the SWR bump in the middle of the feedline as well. You might be better off to run 75 ohm all the way if you can. At least that way the SWR reading in the shack might have some relationship to the reading at the antenna. Note that the reading in the shack will still be way low, but at least it might have a relationship to the SWR at the antenna. With the coax change, I wouldn't bet that there is even a simple relationship between the SWR you see in the shack and what you see at the antenna.

That's primarily because most people try to get by with only half the antenna (the vertical piece without a decent ground). Try putting up only one side of a dipole or a yagi with one side of the elements missing and see how it works :-)

Yep, there's graphs available for this in the trades and I think there
may be an actual chart in the FCC regs somewhere of how they 'see' it.

20,000 Volt Variable Power Supply, Spellman - Ebay

This magnificent power supply is variable 0 - 20,000 volts. It has a meter for voltage and a meter for current (leakage); see the close-up picture below. It can be used to perform hi-pot tests, and to verify insulators and dielectric materials. I purchased it to help in the design of a high power RF amplifier.

It works perfectly. As you can see, it is a rack mount design. The top and bottom are covered with sheet metal, so it can be placed directly on your workbench as well. The front panel and meters are in excellent condition.

I've been told that these sell for about $2000 when new, but I don't know if that's accurate. I purchased it a few years ago at the Dayton Hamvention.

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1679201652

I will be glad to provide additional information. Contact me at
w4tq@mindspring.com

Hoping someone can point me to the right newsgroup or whatever -

I've found a 1960s 4-transistor reflex trf kit, long and medium wave; and
of course the circuit diagram and instructions are missing.

Any sources of suitable circuits would be very welcome.

Thanks, and seasons' greetings -

Bill,
Edinburgh

I had a dickens of a time locating an 11-pin plug recently. AES only
has the 8-pin ones, at least in the catalog. I believe I saw some
11-pin ones at Nebraska Sales and Surplus.
The irony in my story is that shortly after I found one, some guy sold a
group of about 20 on ebay for about $11. Oh well.

>Looking for a 19KHz crystal HC-13 style for a Heathkit IG-37 stereo generator.

I have a later incarnation of the same generator and also needed a 19kHz crystal about 20 years ago. After searching lots of sources I finally found someone who could make up low frequency crystals like this for me. He actually repaired mine (it's only fault was that it was actually a 20,000 Hz crystal instead of a 19,000 Hz.) I bought the generator from someone who had never been able to get it to work, and the fault just wasn't obvious until I got a nice HP frequency counter and started checking things with it.

At that time I wasn't sure whether the repaired crystal would hold up, so I had him make me 2 additional spares, which I still have. I'd be willing to sell one for $35, including shipping. Considering inflation, that's less than I paid for it. These are perfect replacements for the OE Heath part and I have run them in my IG-5237 to verify that they work the same as the original.

I have repaired one of the earlier IG-37s like you have, and the circuitry is the same, except that the ~100 MHz oscillator (at least some units) is missing a cap that lets it actually run at 100 MHz. While I found that the early unit could be made useful as is, it worked a LOT better when the frequency was right. I believe that without the cap the frequency is too high, but it's still picked up as a harmonic or something like that. At any rate the cap was easy to add in and made a big difference in the end result.

I always suspected that at the time Heath did the original design work they just didn't have a 100MHz scope or frequency counter. Or perhaps they did, but just couldn't see that most of the signal was at 200MHz. Sorry, it was a long time ago and I don't remember the details. At any rate I can send you a copy of the later schematic with the crystal and you can take a look at it.

Let me know if you're interested.

This fellow is correct. I wasn't sure what it all meant myself, so I checked Dr. J. L. Norman Violette's treatise entitled "Electromagnetic Compatibllity (EMC) Grounding And Shielding Techniques for EMI Suppression", dated November 17, 1994. Also, a call to an EMI lab would be able to provide an answer to this question.

I have never seen a receiver design with the filters after the limiters.
I guess you could do that, but why? You do want to filter out the undesired
freq's from the IF and then limit the signal as hard as possible to remove
the AM component of the signal. The resultant signal is then detected with
a reasonably good discriminator and then filtered for best audio between the
normal EIA limits of 300 and 3000 KHz. Without proper test equipment, the
best adjustment to the quadrature detector is to tune in a known good signal
and adjust the tuning coil for best preceived audio coming out of the speaker.
Otherwise, you end up requiring a service monitor, SINAD'er, etc and a bunch
of stuff most hams don't have in their tool box. If you still can't get a good
quality signal coming out of the speaker, I would look first at the audio
signals coming out of the first audio filters and then try to see if the
reference oscillator for the freq synthesizer is on freq. If you have a
fixed
freq receiver of the old variety, then you need to warp the LO on freq.

BTW, if the IF signal coming out of the last mixer can be monitored on a good
scope and it is distorted, then you should start troubleshooting the front end.
Once again, with no fancy rf equipment, I would recommend testing the bias
voltages on the mixers and rf amps as the first step.

RF is a pain without spectrum analyzers, etc. Come to think of it,
it's a pain anyway. :-)

Steve Carlton WB4CZR
Plantation, FL

P.S. The input to the last filters is called the "rise" point. Let's hope
I don't have to go through the use of this in troubleshooting. :-)

Modulating the VCO with PL is iffy at best. If you don't end up loading
down the VCO's feedback, you still are adding a low frequency error signal
to the loop which it removes quite nicely leaving you with little PL. If you
are PL modulating a synthesized rig, you should modulate the reference
oscillator and not the VCO.

I've said it a hundred times now. RF is a pain! :-)

Strange, but that is exactly where most ham and commercial two-way
rigs apply modulation--especially the PL tones--for best linearity.
Ditto for data. The reference frequency is normally high enough that
subaudible tones and voice frequencies are not removed
by the loop filtering.

Because without AGC soft limiting or clipping can occur in earlier stages
before
the filters. Some receivers use cascaded filters between the IFA stages--
especially amateur grade receivers. My point was that distortion of the RF
waveform would not affect the recovered audio.

BTW, if you use a Sinadder on a quad detector, you might find how
easy it is to end detuning the detector for minimum audio, instead of
minimum distortion.. The Sinnadder gives great readings with no audio
coming in.

This is what is known as two port modulation. The vco has a modulation
frequency response which is a high pass response and the ref osc has a
low freq response. On commercial rigs, you end up doing alot of juggling
to balance the two ports so that you don't get too much of one or the other.

It is a good idea if we leave this discussion in an IEEE forum rather than here.
Back again to the "pain" aspect of all this RF stuff.

Steve

I hope the agc is not causing clipping. It should only adjust the front
end gain. Distortion would definitely be ungood and the cause of it hard
to trace.
There is alot of engineering going on in such radio's as the Motorola TalkAbout
to keep the front end linear. As they say, "Been there. Done that"

On the SINAD'er, I've never had that problem before, but we were running rated
audio output and were well into the agc range of the SINAD'er. I guess I could
recommend the HP331 method of measurement, but let's go into the 21st century
please. :-) Note: please don't suggest 20db Quieting as an alternative. This,
like RF, is also a pain. :-)

7938. FS: Bird, Tektronix, & HP Test equipment

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-25 21:05:49 UTC
From: Fred Allen <fallen-idc@worldnet.att.net>
Message-ID: <NS5W7.310499$W8.11375249@bgtnsc04-news.ops.worldnet.att.net>
Source record: 47835

I have following Test equipment for sale:

Bird Model 3180 FM Deviation Indicator. Adjust FM Deviation via the LED or with supplied ear phone. Unit runs on 9 volt battery, (supplied), and is in excellent condition. Will handle a max of 10 watts input power.
Pictures can be seen at:
http://home.att.net/~fallen-idc/idc/bird1.jpg

http://home.att.net/~fallen-idc/idc/bird.jpg

Bird Model 8072-1 Coaxial Dry Load. Will handle up to 300 watts continuous when bolted to a suitable heat sink, (supplied). Frequency Range dc to 2.5 GHZ, (VSWR dc to 800 MHz 1.1 max, 1.25 800-2.5 GHZ). Size: 4 25/64" x 2" x 1 /32". Unit weighs, (with out heat sink), 12 ounces. Picture can be seen at:

http://home.att.net/~fallen-idc/idc/dummy.jpg

Tektronix DA 4084 Programmable Distortion Analyzer. Fully automatic Programmable Distortion Analyzer. Unit is in excellent condition.

http://home.att.net/~fallen-idc/idc/tekda.jpg

Hewlett Packard Model 8640B RF Signal Generator. This is the military version of the Commercial 8640B. This unit goes to 512 MHz; it is in very nice condition. Picture can be seen at:

http://home.att.net/~fallen-idc/idc/8640m.jpg

Hewlett Packard Model 8640B RF Signal Generator. This is the commercial unit and goes to 512 MHZ. This unit comes with options 001 and 003. Unit is clean and in good working order. The power switch does not work so it has been hard wired to power up when it is plugged in. A picture can be seen at:

http://home.att.net/~fallen-idc/idc/8640b.jpg

I will warrant all equipment for 30 days, (except the power switch on the commercial 8640B. Serious offers only. Buyer pays all shipping and handling charges. I will ship Fedex or UPS only. Over seas sales welcome. Will also consider trades for other test equipment.

Thanks,
Fred

Another alternative to what I have previously proposed might be to look at the stereo FM transmitter from Ramsey?

I am a little fuzzy on broadcast FM transmission right now (haven't given it any thought for 20 years since I studied for my commercial license).

Maybe their transmitter circuit uses one of these and maybe they could sell you one.

Some watches used a 38kHz crystal - maybe you could
divide by 2 to get the 19kHz?

Cheers.

I too believe this is on the mark, but I am still not satisfied with any answer on the thread so far.

How does one get from power per square meter to microvolts per meter? The units problem bothers me and maybe I am looking over something.

Are we dealing here with a concept similar to the "ohms per square" when dealing with surface conductivity?

Yes, I did think of that, but the tolerances involved in the final signal are +/- 1 Hz.

This crystal would have to be very pullable, and the reality of this type of part is that it is not.

The 38.00053MHz oscillator and associated divide chain yields an accuracy of nearly that unadjusted.

Let S, the power density of the wave, be watts per
square meter. This is equal to

S = E^2 / Z0

E is the electric field strength, volts per meter,
Z0 is the impedance of free space, 377 ohms.

V = E * L

V is the induced voltage, L is the length in
meters of the test antenna.

From these equations,

V = L * sqrt(S * Z0)

is the relationship between V and S.

A test pickup rod antenna appliance is calibrated
over some frequency range in a test chamber that
has a known signal strength S, according to some
certified procedure.

I think 19 kHz crystals are hard to find nowadays.

I'd try to build a small circuit with a 10240 kHz crystal, a MC145151 PLL IC, a 390 kHz VCO locked on the 10
kHz reference and a CD4017 to divide by ten the frequency. The total cost is less than 20 bucks. The
frequency of the resulting 19 kHz perfect square wave is very accurate, far better than 1 Hz.

NOS 12pf NPO ceramics on tape
50/$4 or 100/$7

22uF 35v electrolytics These caps are on paper tape, NOS (New, but old
stock) made by Richey.
100/$2

I have NEW BNC chassis connectors for (includes nut and lock
washer)
============================================================
25 for $14.00
50 for $24.00
100 for $40.00

Voltage Regulators
==================
LM7805C voltage regulators. TO220 case. 5 for $4.00
L7806CV voltage regulators. TO220 case. 5 for $4.00
LM7808CT voltage regulators. TO220 case. 5 for $4.00
LM7812T voltage regulators. TO220 case. 5 for $4.00

3 of each for $10

Key/Headphone Jacks
===================
These are 3.5mm female stereo PCB mount jacks. Can be used in
ugly/manhattan building projects with no problems.
3/$1.35 (or send a buck and a stamp)

Transistors
===========
2N2222A'S in plastic TO92 case - 50/$4.50 NEW PARTS
2N2222's in METAL TO18 case - 25/$7.50 NEW PARTS
2N3906's plastic TO92 case - 50/$4.00 NEW PARTS
```

IRF540's TMOS Power FET, N-Channel, 27A, 100v RDS(on) = .070 Ohms
http://www.onsemi.com/pub/Collateral/IRF540-D.PDF for data sheet
$1.00 each. (TO220 case)

Crystals
========
3.579545 Mhz Crystals for 80m - These are pulls, $1.00 each

POTS
====
10K 1 Turn Panel mount pots. These are pulls. No knobs, just
shafts. Most are Allen Bradley. Pot is about as big as a quarter.
With nut. 5/$4.00

Diodes
======
1N4148 - You always need these. 75 for $2.00 These are NEW.

Speakers
========
Little 2 inch PC speakers, 8 Ohm. $1.50 includes shipping in a
padded envelope. 10 for $8.00 - They work great for little external
speakers on QRP rigs. 1/4 watt

Let me know if you're interested. All prices are post paid to the
USA, unless otherwise noted. I will ship to non USA addresses but we
need to discuss the shipping charges first.

PAYPAL IS NOW CHARGING ME 5% FOR YOUR CREDIT CARD. SO IF YOU PAY
CREDIT CARD VIA PAYPAL, ADD 5%. IF YOU PAY FROM PAYPAL FUNDS THEN
THERE IS NO SURCHARGE. PLEASE REMEMBER, THIS IS NOT THE WAY I FEED MY
KIDS. THEY'RE BOTH OVER 18 AND EAT LIKE PIGS, SO I HAVE A REAL JOB.
I MAY STOP ACCEPTING PAYPAL, WE'LL SEE HOW IT GOES. I SELL THIS STUFF
CLOSE TO MY COST. ANY EXTRA FUNDS MY HAM RADIO HABIT UNLESS THE XYL
FINDS IT FIRST.

I thought the crystals in watches were 38.768KHz. Certainly in digital watches, it's not going to be exactly 38KHz, because it's easier to use binary counters, and they won't divide down evenly.

Someone suggested a Ramsey kit. You're not the only one having problems finding a crystal for this use. While I can't remember what they said, when Radio Electronics ran an article some years back about using a Rohm IC that was both an FM BCB transmitter and a stereo encoder, it needed a 19KHz crystal. Something was said about the lack of availability, and they suggested something that they said would "be close enough". Of course, if you're trying to align something, close enough may not be.

There have also been two or three quite fancy "FM broadcasters" in Radio Electronics (and after it changed it's name to Electronics Now) by Randolph Graff. They all had stereo encoders, and the later ones had synthesizers for generating the FN-band carrier. I forget how they derive the 19KHz signal, but someone with a more easily searchable collection than me might look it up.

Their designs are also available as kits from North Country Radio, I beleive they have a website. So as with the suggestion about Ramsey, North Country might also be a potential supplier (though, I once tried to get an IC from Ramsey that they used in one of their kits, and was told they could not supply the ICs except in the kits).

A vertically oriented tightly-wound helical antenna. What would the
polarization angle be, I wonder?

7949. Re: Need 19KHz Xtal

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-26 18:04:22 UTC
From: Alan Yates <alany@ay.com.au>
Message-ID: <3C2A1124.FC06A37A@ay.com.au>
Source record: 47747

Most cheap stereo encoders (ie BA1404) use a 38.0 kHz crystal. The
fundamental used for L-R DSB supressed carrier signal, then digitally
divided and cleaned up using a LPF to offer the 19kHz pilot.

From: Webster Williams <Doncha@WishuKnew.com>
Message-ID: <MPG.1693e97c71ae971098981b@news-server.sc.rr.com>
Source record: 47749

Hi All,

I'm working on a piece of electronic equipment
that uses two of these. Any chance someone here
might have a cross reference to look up a
replacement? I've tried NTE and SG books, no dice!
Even looked in an old Radio Shack crossover guide,
no such luck. www.diodes.com has nothing on it
either. It's likely from the mid-1960's or early
1970's. It's an ultrasonic cleaner made by a company
called Beckman. No such listing of the company on
the internet either, nor a city on the manufacturers
tag. There is a Beckman-Coulter in California that
knows nothing about Beckman, although they manufacture
similar equipment. No schematic- wouldn't you know it!

Thanks if anyone can help. I know this group isn't for
lab equipment, but I'm a ham and want to use this to
clean variable capacitor plates for antenna tuner
projects!

Thanks, -Webster Williams in Myrtle Beach, SC

Sorry for leaving my e-mail addy off here, I'm sick
of getting SPAM mail! Please just post your answer
here if you have one and I'll pick it up here. TNX!

Depends on the feed wire, since the feed wire will pick up about as much signal as the antenna, if it's approximately the same length as the broomstick. If both the broomstick and the feed wire are vertical, the polarization will be vertical.

Try a web search for "beckman instruments" It will come up with all
kinds of links including "beckman-coulter" which is not what you want.
Of course, with equipment that old, you may never get parts or even a
cross-reference to a newer part. You might get lucky though, so give
it a try.

While it may not look good, to get you going see if you can locate some of the plug in realys. There are versions that have 11 pins. I uesd one about 10 years ago to do the same thing. The new ones are very expensive just to get a plug, but you may be able to locate some on ebay or at a hamfest or maybe a surplus place.

have noted the discussion, but do not feel it is so easy to contribute
as problem may seem different from what is discussed, particularly
when somebody talks about sinewaves....
Have some experiences with MC3359 and similar devices, since they were
used in German Packet radio transceiver, one problem was that the
squelch would function properly if you trimmed it backwards and didn't
have all the noise and gain from early stages. For sufficient
linearity with quadrature demodulators certain complicated
bandpassfilters were suggested by Philips at least for SN76660N
device, while linearity is not usually in discussion for TV receivers
we used SN76660 for NBFM on 455kHz, and had some problems, until it
was suggested in Radcom to use .01 capacitor in the circuit, nobody
around Midland area understood it, but it worked, hi

It was a serious consonant-S-problem with some TV-receivers in early
80's because some quadrature demodulators satured for certain
languages, but it was solved with a larger de-emphasis capacitor
Believe the device was TBA120T used on 5.5MHz SOUND IF.

W32A owners:

I am interested in purchasing (if anyone has one for sale, please let me know!) a RigBlaster NOMIC and using it with a W32A. Before I would purchase one, I am curious if anyone has been successful in such an endeavor?

What are the pinouts for the jumpers inside? What are the pinouts for the cables? Are the cables hard to make?

Hello. Thanks for reading this. I just purchased an HP 456A current probe and amplifier. I need to know what batteries goes in it. Also, if anybody has the specs on the two transistors in this, I'd appreciate that info also.
thanks
John

Note: Non engineers please ignore below as it is a response to obfuscation perceived by me of the original thread's question. :-)

I guess I shouldn't say anything, but this thread is getting open-loop.

No matter how you do it, all "FM" detectors involved are phase detectors. Over a length of time the phase changes in an FM signal can be noted and will deliver eventually the information conveyed by the carrier via the modulating signal. Remember delta phi over delta T? Otherwise, why add the lowpass filter to the output of all of them? Clue: The >average< DC level output varies per delta freq, but it is supposed to.

The constant S problem noted above, I would assume, involves a digital modulated signal. This would have a constantly changing duty cycle. This causes a problem in a detector that is ac coupled as the recovered audio would have a varying average DC level. If this variation is at a frequency much lower than the time constant of the coupling circuit it would not be conveyed to subsequent circuits accurately causing grief for the engineer designing those particular stages. That is ungood as sometimes it is me doing the design. :-)

Believe me, I am not throwing rocks here, I am only pointing out that the FM detector is really not an "FM" detector directly. If you want to flame me for being picky then do it. I am used to it as I have taken grief for 24 years now.

Yes, so I have learned this afternoon in my research...

The original poster, if he ever surfaces again, could try one of those and build an oscillator and divide by two and filter for the sine wave.

I have also learned that Statek may produce these crystals. I saw an App. Note referring to them for the 38 kHz device, and their web page says they go down to 10 kHz if I remember correctly.

I suggested earlier to contact Ramsey and a poster replied that they won't sell parts. I can understand that; don't carry inventory.

Maybe one could contact Ramsey and at least learn of their source of supply. This would be very useful information.

Clyde

P. S. I just looked at the App. Note and indeed it was for the BA1404 device.

Beckman Instrument is a manufacturer of high quality lab and electronics test equipment. Check in the Mouser Catalog for an NTE transistor with close specs. Beckman wasn't like Tektronix or HP in the use of a lot of sole-purpose chips and transistors.

Think in terms of the impedance of free space being 377 ohms. E is equal
to the square root of the quantity power times impedance.

I work at Delco and have some literature
on the old stuff. I can tell you that part
number is a "house number" labeled for
the customer (Beckman) so it is most
likley useless. What you need to do is
determine if it is germanium or silicon.
We made a ton of germanuim power stuff back then. It is just an audio power
amplifier with freq response into the ultrasonic range. You should be able to
select an approprate part.

7969. Applying old RCA tube 8122, is it worth the trouble?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-27 22:51:02 UTC
From: la8ak.xnd@online.no
Message-ID: <3c2ba1ec.96177448@news.online.no>
Source record: 47766

According the data sheet 8122 will provide 570Watts PEP output @30MHz AB2. Full ratings up to 500MHz. DC supply voltage 2200V up to 500MHz and 3000V up to 30MHz.

the tube is quite easily found, but has got an extremely bad reputation in Europe. Some friends have quite large supplies, but it is no interest at all.
First of all: 30% of brand new tubes were found to have internal shortcicuit between control grid and screengrid as delivered and the manufacturer would not take any good in return - even if they were measured on receipt.
Second: Quite many make the same short-circuit when you try to use it, even if you follow all normal procedures.

Recently noted the
SM 5 BSZ - A procedure to recondition power tubes
http://ham.te.hik.se/homepage/sm5bsz/recondit.htm

perhaps this is the extended procedure needed to follow, but would like to hear if somebody has an experience that the tubes may be worth using or should be avoided. 8122 tubes are very much cheaper than all sorts of Russian types, but if they are totally unreliable and causes damage to the equipment it is no good idea to have tried them at all! Several considered the application, but avoided it as reports were noted about all the problems which seem inavoidable

Hi,

I've heard that these small 2m horizontal loop antennas (sometimes stacked 2 or 4 at a time) (also known as sqkloops?) are excellent for sideband. I see them offered for relatively cheap by KB6KQ(.com). However, my Dad and I are interested in building one for fun. Does anyone know if the plans for this type of antenna can be found in QST or in the Antenna book?

We are interested in using one or two of them for 2m SSB (we're just getting started).

Thanks for any help you can provide,

Jason

7975. Convert an industrial RF generator to a linear amp?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-28 12:27:54 UTC
From: Tom2000 <tom2000@mindspring.com>
Message-ID: <87po2uskntrbis8sp22i92d7r17sbjjjp5@4ax.com>
Source record: 47771

Folks,

I stumbled across an eBay auction for a Henry 2000 watt RF generator.
The seller doesn't seem to know much about it, but mentions "13.56 MHz."
This might have been used as a sputtering source.

Looking at the picture, it appears to have a power supply, an amplifier
module, and some other good stuff.

Although I have no need for an amp these days (apartment dweller) the
picture makes me wonder if industrial surplus sputtering sources might be a
relatively inexpensive source of parts for homebrew high-powered linear
amps. They must have appropriate power and bias supplies, tubes (or a
lot of transistors), a maybe-convertible output network, shielded
metalwork, etc. A veritable linear amp construction junkbox.

Has anyone ever taken a good look at the inside of one of these things?

(If anyone's interested, the auction can be found at

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1682291894

I have no connection with the seller.)

Very 73,

Tom AB9B

Here in UK we call them Halo's, basically a dipole bent into a circle,
or "squalo's' bent into a square, and fed with a gamma match.
I have seen some where the dipole is centre-fed and capacitivly tuned
between/across the ends.
Not too bad for horizontal mobile aerial, but down on a dipole.
Cardiac radiation pattern with null at the ends.

I have dimentions somewhere, but nothing too critical for you to fail
with 'cut and try' tuning. Shout if you want specifics and drawings.

hi jason
i dont know what your situation is but 2 meter SSB is not like FM it takes a lot more than a simple unity gain antenna to be able to work SSB and it takes very good feedline and height the higher the better if you where going to be using the halo for mobile i would say go for it but for a base station do yourself a favor and get a good high gain yagi atleast 13 elements on a 15 foot boom feed it with a low loss coax say 9913F or LMR400 and get the antenna as high as possible around 50 feet would be good i have worked a good number of states here from florida with that height and 2 cushcraft 11 ele yagis
good luck

Jason,
Ought to work just fine. Not just SSB, but AM, FM, CW
and what ever other mode you can think of.

I don't know what you mean by 'excellent' for ssb. The loops will not have any gain and are not directional. While you can have some fun with the loops, you should be looking at a beam on no less than a 10 foot boom and longer if you can support it. If you can stack 4 of the horizontal loops you may get close to 6 db of gain over a dipole. Not much to brag on when a 3 element beam will give around 8 or 9 db. The beam will usually be easier to build and get working than several loops stacked and phased correctly. If you want to build something , the quagi type might be a good starter project for the antenna. It is a beam with the reflector and driven element made like square loops and the director elements made like a regular beam.

AMATEUR RADIO NEWSLINE(tm) REPORT #1272 - DECEMBER 28 2001

==========

A NOTE TO THOSE WHO ONLY “READ” AMATEUR RADIO NEWSLINE(tm)

For those of you who only know of the Amateur Radio Newsline (tm) as a text newsletter we would like to invite you to listen to the audio version. This Amateur Radio Newsline (tm) script is actually written for the “spoken word.” It is recorded each by professional broadcasters and is available for private listening or rebroadcast over your repeater. Three methods of delivery are available: Streaming audio using RealAudio, FTP RealAudio or dial-in telephone. Please visit our website at http://www.arnewsline.org for a list of telephone numbers (you have to pay your own long distance charges) and links to audio servers providing our voice newscast (for free).

de
The Newsline Production Team

==========

Amateur Radio Newsline report number 1272 with a release date of Friday, December 28th, 2001 to follow in 5-4-3-2-1.

The following is a Q-S-T.

A not so welcome FCC Christmas present for several hams and an ARRL survey says that most hams no longer want the novice bands. These stories are first on this New Years week edition of the Amateur Radio Newsline coming your way right now.

(Billboard Cart Here)

**

ENFORCEMENT: FCC DESIGNATES KEVIN MITNICK, N6NHG, LICENSE RENEWAL APPLICATION TO PUBLIC HEARING

A convicted computer hacker now has to face an FCC if he wants to keep his ham radio license. This, as the regulatory agency designates the Amateur Radio license renewal application of Kevin David Mitnick, N6NHG, for hearing. We have this report:

--

According to the FCC, Kevin David Mitnick is best known to the world as a hacker who admitted that he broke into a number of computer systems and stole proprietary software belonging to Motorola, Novell, Fujitsu, Sun Microsystems and other companies. He has also admitted using a number of means to commit

his crimes including social engineering, cloned cellular phones ad sniffer programs placed on a victims computer system. Mitnick even acknowledged altering the programming of computer systems belonging to the University of Southern California and using these computers to store programs that he had misappropriated.

Mitnick was sentenced to forty six months in federal prison for his August 9th 1999 conviction. He had previously been sentenced to twenty-two months in prison for possessing cloned cellular phones after his arrest in North Carolina in 1995 and for violating his supervised release that had been imposed after his conviction for unrelated computer fraud in 1989. He is currently on probation following his release from prison in January of 2001. And in December of 1999, Kevin David Mitnick, N6NHG, applied for renewal of his Amateur Radio Station and his General Class Operators License.

His license expired on December 12th 1999. The FCC put the renewal application on hold pending further inquiry. Now the agency has made public that it intends to challenge Mitnick’s right to hold a ham radio license and has issued a Hearing Designation Order. In plain English, that means Kevin David Mitnick has to prove to the government why it should renew his ham ticket or have his license cancelled.

The FCC is challenging Mitnick’s license renewal request on the ground that his past criminal behavior raises a substantial and material question as to whether Mitnick possesses what the it terms as the requisite character qualifications to remain a Commission licensee. The FCC says that in the context of broadcasting licenses, it has long held that evidence of any conviction for misconduct constituting a felony will be considered as relevant to its evaluation of an applicant’s character. It also says that the broadcast character qualifications standards have been used as guidelines in the evaluation of non broadcast licenses including those in the Amateur Service and that the courts have upheld the Commission’s right to do this.

The agency cites two recent cases. That of Herbert L. Schoenbohm, the ex-KV4FZ and Leslie Brewer who used to be KC4HAZ. Brewer, also known as the Tampa Party Pirate lost his ticket because of his unlicensed broadcasting in the commercial F-M band . Schoenbohm lost his based on a fraud conviction of using an unauthorized telephone access device. And the FCC says that any conviction for fraudulent conduct calls in question a licensee’s ability to act in a manner consistent with FCC regulations.

And so the FCC has ordered that a hearing be held before an Administrative Law Judge to determine the effect of the criminal convictions of Kevin David Mitnick on his qualifications to be a Commission licensee. It also says that pursuant to provisions of the Communications Act, the burden will be on Kevin David Mitnick, N6NHG, to provide proof that his license renewal application should be granted. Mitnick was given 20 days of the mailing of the Hearing Designation Order to file a response.

For the Amateur Radio Newsline. I’m Andy Jarema, N6TCQ.

--

The hearing designation order on Mitnick’s license was adopted by the Commission on December 11th but not released until Friday, December 21st. Ironically, less than twenty-four hours earlier, Mitnick had made a guest appearance on Art Bell’s Coast to Coast A-M where he discussed his future plans. At that time he was apparently unaware that the FCC had some plans of its own in regard to whether or not N6NHG will remain a radio amateur and Commission licensee.

The complete text of the Mitnick FCC Hearing Designation Order is on the web at: http://www.fcc.gov/Daily_Releases/Daily_Business/2001/db1221/fcc01359.txt (FCC)

**

ENFORCEMENT: GERRITSON LICENSE PLACED ON HOLD PENDING POSSIBLE HEARING

Kevin Mitnick, N6NHG, is not the only person hearing from the FCC in recent days. So have a number of others including another Southern California resident who could face the same kind of a hearing. Riley Hollingsworth, K4ZDH, is the FCC’s Special Counsel for Amateur Radio Enforcement:

--
Hollingsworth: “We notified a Bell California licensee; Jack Gerritson, ex-KG6IRO, that the Wireless Telecommunications Bureau, had set aside his Technician grant so that a recent conviction for radio interference could be evaluated. Now, he has no authority to operate Amateur Radio equipment until the matter is resolved.”
--

The action to place Gerritson's license up for hearing was taken November 14, 2001 and is based in part upon complaints about the operation of his station and questions regarding Gerritson's qualifications to be a Commission licensee. The FCC says that both issues were raised as the result of Gerritson's 1999 arrest and year 2000 conviction for interference to police radio communications. (FCC)

**

ENFORCEMENT: FCC REOPENS KY-W.VA REPEATER CASE

The FCC is also continuing its crackdown in the area of repeater interference issues. In fact it is taking a second look at a coordinated versus uncoordinated issue in the Tennessee and West Virginia border area. Again, Riley Hollingsworth, K4ZDH:

--
Hollingsworth: “We notified parties in a repeater dispute in West Virginia that we would be reopening that case after information that one of the repeaters is coordinated after all. We had declined to intervene earlier this year in that case.”
--

The letter stating that the FCC is reopening that case went to Michael Horn, KB8GDF, of Lenore West Virginia, Kenneth Brown KF8HL of Davin West Virginia and Carl Tussey, KB4UCE of South Williamson Kentucky. Back on January 24, 2001,

had notified the three that it had received a complaint that they were operating an uncoordinated repeater on 145.390 MHz in Mingo County, West Virginia, and that this repeater was causing interference to the coordinated KC8FKP repeater operated by the Portsmouth Radio Club that uses the same frequency. The matter was closed when the FCC interpreted a notation in the South-Eastern Repeater Associations Repeater Journal that the status of the KC8FKP repeater was not known and interpreted this as meaning that the repeater was also was not coordinated.

But now the FCC says that it has recently come to it's attention that although in the SERA Repeater Journal says that the KC8FKP repeater may be listed as unknown, it is still a coordinated system. Therefore, the FCC is re-opening its review of the issues in this matter. (FCC)

**

ENFORCEMENT: IS A GOVERNMENT AGENCY RUNNING A HAM REPEATER?

Is a government agency operating ham radio repeaters in violation of Part 97 rules? Specifically, the FCC wants to know who is really running the KD6LSO and W6SON repeaters in Sonoma County California.

The FCC says that it has received allegations that the county is in charge not the hams whose call signs appear on the machines. Since a county governmental entity cannot be an Amateur licensee, the FCC is collecting information in order to determine if there are breach of its rules. (FCC)

**

BREAK 1

This is ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on bulletin stations around the world, including Rocky Mountain Radio League repeaters serving Denver and Bloomfield Colorado.

(5 Sec Pause Here)

**

RESTRUCTURING: ARRL STUDY SAYS NOVICE BANDS MAY NOT BE NEEDED

An ARRL study group has recommended doing away with the current novice bands and divvying them up among the remaining licenses classes. Amateur Radio Newsline's Norm Seeley, KI7UP, has the details:

--

An ARRL Novice Spectrum Study Committee has recommended that the League petition the FCC to eliminate the CW novice subbands. It also wants a rules change that will allow Novice and Technician licensees with element 1 credit to be permitted to operate Morse code on the General 80, 40, 15 and 10 meter C-W allocations at up to 200 watts power out.

These are just two of the suggestions contained in a report that will be presented to the Leagues Board of Directors when that group convenes in mid January. The study committee will also suggest recognizing portions of the 80, 40, 15 and 10 meter Morse bands for what it calls ''slow CW operation.'' The committee says that this would aid new operators in enhancing their Morse code skills.

Finally, the panel also recommends re-farming -- that’s another way of saying reapportioning -- reapportioning the current Novice and Tech Plus subbands in part. This, to allow expansion of the phone allocations on 80, 40 and 15 meters.

What will the ARRL Board of Directors do? We should know in less then a month.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP

--

The committee's determinations were based on opinions expressed by 4744 hams who respond to an ARRL Novice Spectrum Study survey launched last June. Those expressing their opinions included ARRL members and also non-members. What’s really interesting is that nearly 61% of those responding were Extra class licensees. (ARRL bulletin)

**

FCC INSPECTOR GENERAL'S REPORT: THE NAMES THE SAME

The latest report of the FCC's Office of the Inspector General contained very few items of intrigue. But according to the C-G-C Communicator, one of the more colorful incidents involved a person who allegedly used the name of an FCC employee to obtain the government-rate for a hotel room in conjunction with a government-sponsored event.

Well, it turns out that the subject was legitimately attending the event, was entitled to the government room rate and just happened to have the same name as the FCC employee. The bottom line: Case dismissed.

The complete report is on the FCC website at http://www.fcc.gov/oig/Semiannual093001-1101.pdf (CGC Communicator)

**

AMERICA AT WAR: NYC PHONE SERVICE STILL SPOTTY

It's been almost four months since the attack on the World Trade Center, and telephone service near ground zero in lower Manhattan is anything but normal.

According to news reports, repair people have restored service to most customers, but thousands of lines still aren't working. As a result, customers complain that some business lines can call out, but customers can't call in.

The collapse of Seven World Trade Center crushed thousands of underground cables at Verizon's nearby switching station. About 200-thousand telephone lines and three-point-five million data circuits were affected. The company says it'll spend as much as one-point-nine billion dollars to repair the

damage. (Telecommunications Online)

**

INTERNET SECURITY: PROBLEMS WITH XP

If you just bought a new computer equipped with the Microsoft X-P operating system, or have upgraded your old one, listen up. The Federal Bureau of Investigation says that you should take certain steps to protect yourself against hackers who might try to take advantage of major flaws that have been found in X-P.

The bureau's National Infrastructure Protection Center says that in addition to installing a free software fix offered by Microsoft on the company's Web site, consumers and corporations using Windows XP should disable the product's universal plug and play features as well. The FBI also warned computer system administrators to actively monitor for specific types of Internet traffic that might indicate an attack was under way.

The FBI did not provide detailed instructions how to disable plug and play. Outside experts also caution that disabling the affected Windows XP features threatens to render unusable an entire category of high-tech devices about to go on the market. This includes a new class of computer printers that are easier to set up. But the same experts also acknowledge that disabling plug and play in X-P could afford some protection against similar flaws discovered in the future.

Microsoft considers disabling plug and play options as being unnecessary but the company does acknowledge that Windows X-P suffers from serious problems that can let hackers steal or destroy data files across the Internet or implant their own unwanted software. The FBI says that the glitches were unusually serious because they allow hackers to seize control of all Windows X-P operating system software without requiring a computer user to do anything except connect to the Internet. (Published news reports)

**

THE LAW: A FIGHT AGAINST GRAY MARKET ELECTRONICS

A group of American high-tech companies is opening the year 2002 with a campaign to protect consumers from unwittingly buying consumer electronic products intended for foreign markets. Electronics that the manufacturers claim may not work in the United States.

Compaq Computer is one of the companies involved in the campaign. It says that the group will warn consumers about the dangers of buying such products, and how to avoid getting duped. The other companies in the group are Hewlett-Packard, 3 Com, Nortel Networks, and Xerox. The effort may prompt more lawsuits against distributors who resell so called gray market items in the United States. (Computer Products Daily)

**

SPECIAL EVENTS: USS ARIZONA K7A A SUCCESS

Steve Gurley, KJ7WK the coordinator of the USS Arizona Special Events Station K7A tells the Amateur Radio Newsline that the event was an overwhelming success. Gurley says that the memorial station contacted amateurs in all 50 states, and 8 other countries while handling over 2600 QSO's. In fact says KJ7WK, the sponsoring group has already received certificate requests from 609 stations as we go to air. There were ten operators in three counties in the Phoenix Arizona metroplex operational during most of the three days K7A was on the air. (KJ7WK)

**

SCHOLARSHIPS: DARA SCHOLARSHIPS FOR 2002

The Dayton Amateur Radio Association says that the nominating period for its annual scholarship program is now open. The deadline to receive applications is June 1, 2002 and the announcement of winners will occur around June 15, 2002. Applications are available from the DARA Scholarship Committee, 9873 Lower Valley Pike, Medway, Ohio 45341. Please note that this is a new address from years past. Again it is the DARA Scholarship Committee, 9873 Lower Valley Pike, Medway, Ohio 45341. Also, for more information on the Dayton Amateur Radio Association and its programs, please visit www.dara-w8bi.com on the world wide web. (DARA)

**

AWARDS: DARA OPENS NOMINATIONS FOR HAM OF THE YEAR

The Dayton Amateur Radio Association also asks that we remind you that the nominating period for the 2002 Dayton Hamvention Awards is now open. There are three awards presented each year. They are the Radio Amateur of the Year, Special Achievement, and Technical Excellence.

All amateurs Novice through Extra are eligible. Awards are decided by the Awards Committee, based partially upon the information received. Magazine articles, newsletters, newspaper clippings, videos and the like are appreciated but cannot be returned. The deadline for nominations is January 31, 2002. Nominations should be sent to Post Office Box 964, Dayton Ohio 45401. They can also be submitted by completing the e-form on the web at www.hamvention.org. (DARA)

CHANGING OF THE GUARD: BADGER STATE SMOKE SIGNALS EDITOR JIM ROMALFANGER, K9ZZ - SK

I’m Bill Pasternak, WA6ITF.

The ham who put the state of Wisconsin on the ham radio map has passed away. This, with word that Jim Romelfanger, K9ZZ died Saturday evening December 22nd of an apparent heart attack..

According to Romalfanger's close friend Ken Ebneter, K9EN, Jim has been in declining health for some time. Romalfanger had a stroke a few weeks ago, affecting his right arm which was already weakened by polio. But Ebneter says that K9ZZ seemed to be improving until just recently. Ebneter says that Romalfanger had been in the hospital early last week but was home when he passed away of an apparent heart attack. In fact, K9ZZ had stopped by to visit a ham radio friend that afternoon. Another friend found him dead that evening when he stopped by to visit.

His full name was Arthur James Louis Romelfanger but to the world of ham radio he was Jim, K9ZZ. And Jim Romalfanger made Wisconsin a ham radio household word by editing as three decade state-wide ham radio monthly newspaper called Badger State Smoke Signals -- and doing so as a volunteer.

Notice we said newspaper and not newsletter. This is because Smoke Signals is just that. A newspaper that at its peak ran up to 40 pages filled with articles about ham radio in the Badger State. In addition to being the 32 year editor of Smoke Signals, Romalfanger was nationally published over the years in CQ, QST, 73, Ham Radio, Popular Electronics, and other magazines.

Jim Romalfanger was first licensed January 1958 in Pacific Beach, California, as KN6LWB. Upgraded to General in May of 1958. He returned to Wisconsin that summer and became K9PKQ. In 1977, changed call to K9ZZ and held that call sign the rest of his life. Funeral services were scheduled for Friday, December 27th at St. Joseph Catholic Church in Baraboo Wisconsin.

Jim, from all of your friends at the Amateur Radio Newsline: We are going to miss you. (The Baraboo News Republic, K9EN, WB9QZB, and other friends of K9ZZ contributed to this report.)

**

AMAZING DISCOVERIES: CIRCLES WITHIN A CIRCLE

One of the most curious pure mathematical discoveries for 2001 was announced in the easy-to-read article at an incredibly long website. In brief the article says that research has led to some remarkable geometric findings involving interrelationships between tangent circles and spheres. In other words, mysterious circles within a circle.

As one researcher put it, "Where do these numbers come from? What's going on here?" Find out by going to www.sciencenews.org/20010421/bob18.asp (CGC Communicator)

**

INTERENATIONAL - CANADA: NEW ALBERTA SM

On the international front, word that Thomas Martens, VE6TRM, has been appointed the new Radio Amateurs of Canada Section Manager for the province of Alberta and the North West Territories. Martens replaces Alan Faint VE6QQ will

be stepping down from the position due to personal reasons. Martens will serve the remainder of Faint’s term which runs through June 30th, 2003. (RAC)

**

INTERNATIONAL-AUSTRALIA: CSIRO MICROTURBINES

Australian hospitals, restaurants and schools could soon source clean, reliable energy from mini power generators that operate independent of the main grid. This as CSIRO has installed Australia's first commercial microturbine, at their North Ryde Laboratory, Sydney.

The size of a small refrigerator, the turbine produces 30 kilowatts of power, independent of the electricity grid. And it does this with reduced greenhouse and other gas emissions. Thirty kilowatts is enough to power a medium commercial building such as a restaurant.

Along with fuel cells, gas engines, storage technologies and some renewable technologies, microturbines can be used to generate power close to the end-user and provide major gains in reliability and power quality. Once the design can trickle down to the home user level and price range, it could offer hams a way of always having emergency power always at hand. (Q-News)

**

SHORTWAVE MONITORING : RADIO NORWAY CLOSES

The Board of Directors of the Norwegian Broadcasting Corporation has decided to stop its own programs by Radio Norway International. This is effective as of December 31st of 2001.

According to DF5SX and G3VGW, Radio Norway’s final show was hosted by veteran broadcaster Einar Lie on New Years Eve. Also, the 1200 kilowatt Medium Wave transmitter on 1314 kHz on Kvitsoy was supposed to cease operation by December the 31st as well.

The Norwegian Broadcasting Corporation will have to negotiate with transmitter providers Norkring and Radio Denmark to close down as well. The Norwegian Broadcasting Corporation and Norkring have a contract for running the transmissions that goes through December 31st, 2003. The agency also has a leasing agreement with Radio Denmark for the same period. (Media Network)

**

DX

In D-X, keep an ear open for King George Island in the South Shetland group. HFZ0POL is reported on all H-F bands, including the newer ones, using CW, SSB, RTTY and PSK31. QSL HF0POL via SQ5TA.

And the United Arab Emerates has been heard lately A61AJ. He has been QRV on 40 meters CW around 1400 UTC. Q-S-L A61AJ via N4QB. (Various DX sources)

**

THAT FINAL ITEM: RILEY SAYS THANKS

And finally as the year 2001 comes to an end, the FCC’s Chief Rules enforcer, Riley Hollingsworth has some words of praise for the ham radio community. He passed them along through his bi-weekly Enforcement Log at www.rainreport.com, and thanks to them, we have is words for you:

--
Hollingsworth: “I would like to point out Hap, that this is the end of the third year of Amateur Radio enforcement and I will honestly say that the overall level of compliance in the Amateur Radio Service is outstanding. The Amateur licensees do a great job and they do a great job of showing that the Amateur Radio Service is -- indeed -- the only fail-safe communications system in the world and we are very proud of them.”
--

And if I can take off my reporters hat for a moment and editorialize a bit, I guess I speak for many who truly appreciate what you have done to return the Amateur Radio bands to the law abiding members of the nations ham radio community. (ARNewsline(tm), RAIN)

**

NEWSCAST CLOSE

7984. Trance-Formation of America: Epilogue

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-28 22:06:26 UTC
From: alexandra@trance-formation.org

Cross-posted to: rec.aviation.ultralight,rec.radio.amateur.dx,rec.travel.africa,rec.radio.amateur.homebrew

The safety and serenity of Alaska provided an atmosphere conducive to deprogramming, despite the pandemonium that ensued. Mark Phillips was the first man who not only did not abuse us, but cared for our welfare and well being. His patient, gentle manner was therapeutic, while his propensity for handling weapons and apparent intellect kept us safe against all odds. Through his noble actions, Mark taught Kelly and me that the world of human interaction in which we had existed for so long was contrary to most human behavior. We learned that goodness does exist on this Earth, and that there were those in Washington, D.C. who refused to tolerate the mind-control atrocities they witnessed us and others enduring.

As my eyes opened and I woke up to reality, I became enraged. Enraged for the traumas inflicted on my daughter. Enraged for a lifetime of abuse at the hands of our country's so called "leaders". Enraged that the American public had no idea as to who and what was/is running their country. Mark helped me refocus my rage in a productive direction when he told me, "The best revenge is total recovery."

I began recovering at the rate of 18 hours a day through intensive therapy destined to restore my memory and, ultimately, my mind. I learned the ins and outs of my own mind and recovered my memories in a journal. The stack of journals grew as over a decade of White House/ Pentagon-level abuse flooded my mind and intruded on my thoughts. Pictures from my past flashed across my mind as neuron pathways opened in my brain. I was regaining access to my own mind and control over my future by recovering my memory of my past.

Best of all, I was falling deeply in love with Mark Phillips. Why wouldn't I fall in love? He rescued my daughter and me from certain demise, restored my free will, and was helping me recover in total safety, and was the polar opposite of my abusers. He treated me with love, respect, and thoughtful consideration . Equally as important, Mark proved to be an ideal father figure to Kelly. He provided here with unconditional love and deep understanding. Through him, Kelly caught a glimpse of how kind men could be--and how good life could be. I had long since ceased to know that such a man even existed.

The love factor in my recovery is considerable. Not only did Mark Phillips save my life, but now I had a reason to live it! The love we share kept me going at times--like when Kelly was institutionalized in 1989 for homicidal/suicidal behavior. The loving relationship that Mark shared with Kelly during our short year together as a family was sufficient to arm here with the strength to survive her ensuing ordeal

as a victim of the so-called mental health and criminal justice system.

Kelly, now 15, remains a political prisoner in the custody of the State of Tennessee where she is denied qualified therapy for the MK-Ultra Project Monarch Mind-Control abuses she endured. The state of Tennessee, under the politically powerful influence of Kelly's abusers, is in violation of numerous laws and basic civil rights in their determined efforts to keep Kelly from qualified therapy and the family she loves.

While many of those in positions to make a difference in Kelly's case operate on a "Need to Know" basis rather than deliberately conspire with the bad guys, a closer look into Kelly's case history should raise serious questions in their minds. Questions like; "What could a child have to do with the so called "National Security" of our country?" The Juvenile court judge presiding over Kelly's case closed the doors to the media and onlookers for "reasons of National Security" while gross and blatant violations of laws and rights ensued.

For over three long years, Kelly and I have been denied our right to an unbiased attorney while court-appointed advocates and so-called "guardians" join forces with attorneys paid off by me pedophile father. My own court-appointed attorney, who doubles for the Juvenile Court judge when he takes a day off, has yet to represent my interest. My interest is in Kelly's well being and future-- and if she will have a future at all.

While Kelly is still amnesic with regard to most of her past, she is deliberately denied therapeutical access to her past, due to who and what she will recall. I am denied access to Kelly for fear she would be triggered into remembering by my mere presence. As for my deliberately "triggering" Kelly to remember what she was supposed to forget, as her abusers fear, it has been my experience that recovery must come from the inside out. Not from outside input. I want no less for Kelly that the piece/peace of mind I have gained through qualified rehabilitation. Which raises the questions: Why has the Juvenile court prohibited us from saying the name "George Bush?" Why is the "Wizard of Oz" a taboo subject for Kelly while the State of Tennessee provides her with Stephen King horror novels? Why are Kelly and I forbidden by the court to say the words "President," "politics," New World Order", and "mind-control"?.

In an attempt by state employees to "normalize" our relationship, Kelly and I are forbidden to discuss the past, my immediate efforts to affect her dire and desperate situation, or future plans as a family.

Most appalling and unjust in Kelly's view is the State of Tennessee's refusal to allow her any contact whatsoever with Mark Phillips. While I am hindered from having private conversations with my daughter due to court ordered supervisions and censorship, Kelly is denied the right to even wave to Mark across the parking lot. Considering that, like me,

Mark has never been named as an abuser, declared unfit, or violated any court orders, the questions must be asked: "Why does the State of Tennessee go to such lengths to ban all communication between Kelly and the man who rescued her and taught her the meaning of unconditional love?"

Kelly has asked these questions for years to no avail. The State of Tennessee refuses to even acknowledge her request for"an unbiased attorney who will represent her interests instead of those of the state". Kelly's pleas for an attorney to represent her go no farther than the deaf ears of the assigned state social worker "managing" her case. This social worker is operating on a "Need to Know" basis that has no basis, and she "Needs to Know" that she, along with the State of Tennessee, will be held accountable in the event that Kelly hurts someone or herself.

Kelly's frustrations have mounted beyond her ability to cope. I applaud Kelly for her determined but weakened efforts to stay in control of her own mind despite being denied qualified rehabilitation for the devastating results of Project Monarch Mind-Control abuses. Kelly's daily attempts to accomplish the impossible by psychoLOGICALLY managing her psychiatric disorder is proportionate to her high intellect and willful determination. But it is not enough to fend off the Psychological Warfare that has been waged against her through CIA Damage Containment practices designed to keep her contained in amnesic silence. She needs help. She needs a collective voice.

Kelly can be helped through public outcry and through abolishment of the 1947 National Security Act (and 1984 Reagan Amendment to same) that has destroyed the true security of our once great nation. You can write the State of Tennessee demanding to know why Kelly is being denied her right to qualified rehabilitation.

Thank you. - Cathy O'Brien

Every submitted comment of encouragement will be greatly appreciated!

7985. Alliance HD73 - Need info ASAP!

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-29 00:08:29 UTC
From: Scott McClements <yetbbwa@grove.iup.edu>
Message-ID: <3C2D097D.6B5F275B@grove.iup.edu>
Source record: 47782
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.space

Hopefully somebdy can help me with this one quick before I fall off my tower into a snow bank!

There was some remodeling done in my room where my rotot box was once hooked to my Alliance HD73. Problem is, the wires were removed from the control box without being marked.

So, here is the good part, I broke down, in 20 degree weather, with snow flying, wind blowing, I climbed to the 30 foot height and opened up the rotor wire cover to see what wires went where.

Here is the part I couldn't totally confirm for sure, I could only see a number "2" mark on one terminal connection.

So, here is the terminal connections as if the rotor was oriented as it were mounted in a tower and you where standing on the ground looking at it:

A 2 C
X X X

X X X
D E F

The "X"'s represent the terminal hookups. The letters represent the terminal (number) hookups in question. The "2" was the only terminal I could confirm.

So, the question is, which terminal is which number?

My rotor is the latest model, the HD-73-1, I believe its called. I found the manual online (ftp://bama.sbc.edu/downloads/alliance/hd-73/) - but it was for the HD-73. I went to the troubleshooting section and found where it tells you was resistance to look for between the wires to help straighten out which wire is which. All the resistance values checked out except the last note on the troubleshooting section where it says "Also, leads 1,3, and 6 should not show continuity to leads 2,4, or 5"

I see a some resistance between all combinations of these leads they state should show "no continuity" (open?)

Help, please!

Scott.

Hi Guys;
Any builders out there that need some inductors?
Here are a few bags of them>>
1)- 95 NOS Wire Wound on Ferrite(?)
Price is $20ppd (sold pending payment)

http://www.baltimorepress.com/~wa2rqy/95inductors.jpg
2)- 39 NOS Wire Wound, read about 395-398uh on my B&K bridge, $18.00ppd

http://www.baltimorepress.com/~wa2rqy/39inductors.jpg
3)- 70 NOS 180uh Wire wound, 5/16"d x 3/8"lg + base.
have Yellow, Brown & grey dots on each, $20ppd

No, it's even older than that. It uses "instant heat" vacuum tubes (peanut tubes like the 1AD4). I still have a P33BAM which is the 7 watt model (used a 2E24 in the final).

Message-ID: <3c2d86f3$0$79589$e2e8da3@nntp.cts.com>
Source record: 47788

I haven't played with the RF sources much, but the tuner is kind of wicked.
Picture trying to dump some DC or some RF in to quartz, which is what we
were vaporizing. When you start and the quartz is cold, it is a pretty good
insulator. (but then, you knew that.) When you warm it up it starts to
conduct pretty good. The tuner has to follow the load impedance from
an open circuit down to a pretty low impedance.

The tubes are kind of big, and so is the power supply. Also, it all needs
to be water cooled.

I played a lot with the electron gun supplies, they ran 15KV at 1Amp and it
is my understanding that is not really all that much as those things go.

It seems like a bit much, tho, if all you are trying to run is a full
legal gallon...

The only place a three element beam will gove 8 dBd is in the dreams of
some antenna designers/merchants.

Thanks for posting Richard. I'm wanting to obtain a digital VFO to replace the analogue Local Oscillators/VFO's in some tube rigs, and to have digital readout. I think, (not being an educated man in electronics) that what you have designed might be the kind of thing I'm after. Interesting about using stepper motors as tuning knobs (rotary encoder).

You are correct, but like the merchants I just said db and left out the i. Also maybe I should have added in the ground reflection that one of the vhf merchants use and get about 6 more db.. The whole point was that a small beam is easier to construct and match than it is to build and phase several horizontal loops. Especially for a beginner.

If it is that old then you might be able to get some help from the people that run the Motorola museum. Call 954-723-5000 and that will get you to the operator at Moto in Plantation Florida. Ask to speak to Mike Briley. Tell him your situation and that you heard his name from Steve Carlton. He is a great guy and can probably guide you into someone that can help.

BTW, if you are a golfer, let him know as he is a fanatic. :-)

Hope this gets you info.

I use one from M2 on my truck, along with 150 watts and have no problem talking to bases with horizonal beams a few hundred miles away. A horizontal beam for the base will work better if you don't need to hear in all directions at the same time.

Hil,

A box of totally unknown valves was found when we were counting valves
and other components in these last days of 2001.
It is a 7-pin miniature type, like 6C4 and others, and it is made by
the Swedish factory LM Ericsson. It is RZC 1021 and I would guess that
it is some kind of a trigger or maybe a voltage stabilizer. It has
only two vertical metalplates inside the bulb. No ordinary cathode or
grid.
Can anyone help?

Best regards,

Arnold Goksyr

DEMOSTENES - N6899 Balestrand, Norway

If you mean electret microphone elements , these are excellent and very low
in price.

A low cost 'booster' mic was described in QST -August 1989 , pages 19-20-21
.Article by Doug DeMaw , W1FB (now SK).
The mic element is electret ,its signal amplified by a NPN transistor
,2N3904 followed by a 741 opamp. It incorporates low- and high boost tone
control to be set by potmeters or trimpots.
It gets its power supply from a 9 V battery (nowadays a similar supply is
often available from one of the microphone socket pins of a transceiver.

The Radio Shack elements will do a good job of directly driving a Kenwood
radio, without any amplifiers. Some other models of radio (Icom?) will
require the amp.

One design I used with good luck... Solder a stiff solid wire (#12 or
larger, about 6" long) to the grounded lead of the element. Also connect
the shield of two feet or so of shielded wire to this point - connect the
center conductor to the "hot" lead of the element.

Solder a large alligator clip to the other end of the solid wire. Clip it
to your glasses to hold the mike in front of your mouth. (if you don't wear
glasses you're out of luck<grin>)

At the radio, connect the shield to ground. Connect the center conductor to
a 10K-ohm resistor and a 0.1uF capacitor. (as small as possible, you want
them to fit inside the mike plug.) The values are not critical, 2.2K-47K-ohm
and 0.05-0.5uF will probably work just as well. Connect the other end of
the resistor to the +8V pin on the mike plug, and the other end of the
capacitor to the mike audio pin on the plug.

I've worked a few thousand QSOs that way before finding out that computer
multimedia headsets are the same thing & don't require nearly as much work
to build<grin>! (plus you get a fairly decent set of lightweight,
comfortable headphones...) (plus they work even if you don't wear glasses)

I don't see that buying an element is the right thing to do if you want to build a microphone. The element is, after all, the microphone; everything else is just connection and mechanical support.

Now, if you wanted to wind a little coil and get a magnet to make a dynamic microphone, you might get my attention.

No, No, No. None of this modern dynamic microphone stuff.

Build a carbon rod microphone. Two razor blades on a piece of wood,
and a carbon rod from the inside of a D cell.

It actually does work, but they aren't exactly reliable. I helped
someone make one a few years back for her science fair project.

Hi Jason,

try a quad beam two to five elements (11 units gain if you use five elements)

here is site for plans: http://www.softcom.net/users/kd6dks/quad.html

yes, you can stack them if you want, just watch the phasing cables.

http://www.cebik.com is another great antenna resource.

73 mark II

Please shed some light on how this is done.

I have an audiophile acquaintance who built his own, but I doubt that I could get his attention to talk about it.

How do you make it linear in frequency response and what are the pitfalls? Reference reading you can recommend?

Clyde

Source record: 47714

Well I am no expert on this but I imagine the major consideration is the diaphragm and its support.

Basically, a dynamic microphone is a tiny loudspeaker. You build it essentially the same way. Then the enclosure will determine its directional characteristic. Normally microphone diaphragms are rigid, more like tweeters. They need to be very light so as to respond most readily to pressure variations, and small to be a negligible part of a wave length of the highest frequency sound desired.

I read a book called Microphones. It was published in England I believe, and it is about 40 years old. There is much good information in there; perhaps you can locate a copy. I'm sure there are other publications extant but I don't know any specifically.

Pezoelectric microphones are harder to obtain flat frequency response, I believe. These are called crystal or ceramic and have lots of peaks and valleys. Capacitor microphones offer some interesting possiblilities and might be easy to build. They are essentially a parallel plate capacitor and the capacitance varies with the sound. It does require some interesting circuitry but that's the easy part.

There's some Novus products available at AES
http://www.tubesandmore.com The finest grade will do on transparent plastic lenses. I have some GT88, a 'miracle' 1-800 toothpaste tube substance sold on late night TV in Canada by the DiDiSeven folks. It works great also. There was some equivalent US brand years ago...there probably still is.
Its a nice product for this use...takes a tiring bit of rubbing but an old plastic face can be made to look like new if there's no bad gouges.

8023. Boost/Buck transformer ratings?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-30 22:17:20 UTC
From: w9wi@linux1.localdomain
Message-ID: <slrna2v6ci.f4j.w9wi@linux1.localdomain>
Source record: 47720

Just replaced the defective transformer in an AL-80A amplifier. The replacement works fine, but it's lacking the boost/buck winding. (it was an after-the-fact option in the original Ameritron design) The 230V in this house is closer to 246 and as a result the HV is pretty high, higher than I'd like.

I presume I can safely stick a 230v=>18v control transformer in a box & wire the secondary in series with the AC line going to the amp. (of course making sure the phase is such that I get 228v and not 264!) I also presume the rating of the 18v winding needs to be equal to the rated full-load draw of the amplifier. (plus a reasonable safety margin) Any hidden gotchas in this scheme?

Nope you have the right idea. The bucking transformer will actually absorb power and send it back to the power line.

In Oz, we have a product called Brasso which is a metal polish for copper and brass. It includes a very fine abrasive and is applied and polished with a soft cloth, it works a treat on lots of plastics.

You probably have similar products, but test them on something of no value.

>this scheme?

Yes, there are hidden problems.

First, I hope the replacement transformer you have is a good one and
has the correct filament voltage. the voltage at the TUBE pins should
be around 5 volts no load.

The bandswitch gets marginal with no-load HV about about 3000 volts or
so, so you want to stay below that voltage. You want good regulation
so no-load to full-load voltage does not change an excessive amount.
14% change is about the maximum you want.

The addtional transformer will increase the ESR of the transformer in
the amplfier, so you would be well-advised to greatly overkill the
secondary rating of the buck-boost transformer.

Keep in mind most control transfomers aren't designed to be "stiff",
they generally have very high ESR. You want the buck-boost transformer
to handle the PEAK current of the amplifier primary winding, not just
the RMS current. There is considerable power factor in the amplifier,
because it is capacitor input. That means any additional ESR has a
much greater effect than you might think.

That's why a buck-boost on the actual AL80 core (where the flux is
common in that big core, and there is no need for the resistance of an
additional primary) does not cause much loss of regulation, but an
external buck-boost often does ruin regulation!

With a control transformer designed at about three or more times the
RMS primary current things are often OK.

I can't find the plans now, I did have them bookmarked,
and the website told you everything you needed to build
the loops. But- like you're finding out, they're not
necessarily for base station use. In mobile use, however,
that's the best thing going. Do a search on the 'net for
"build a loop antenna" and you'll probably get back a
couple of the sites I found. Make sure the search request
is in quotation marks, or you'll get back a bunch of junk.

Finding it difficult to purchase some special product for this purpose
in a third world country I just use car-polish and water.
That is the polish which contains the very fine abrasive
to make old paint shine again - not just wax. Works OK on
plexiglas/acryl and all. Be carefull not to apply too much pressure when
using a lambswool polishing disk in the drill. It will heat up the acryl
and make everything worse. To avoid cracks in the meter cover I would
also make a little wooden block that fits into the cover from the
backside and fix this to my workbench. Then you can apply pressure without
breaking the cover. Work slowly and have patience.
You can even polish out deeper scratches. Well, they do not really
disapear but the edges of the scratch get smoothend out so it isn't
visible anymore.

Regards, Ike

8032. Re: Quad. Detector Coil Adjustment?

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-31 15:00:36 UTC
From: tom_bruhns@agilent.com
Message-ID: <3832adca.0112310700.32e7bcef@posting.google.com>
Source record: 47729

No flames, just a few questions that may help folk make up their own minds.

o If we put an unmodulated signal into a quad detector (MC3359
for example), and set it on-frequency and then above and below
the center frequency, is the response we get like we expect
from a phase (PM) detector, or from a frequency (FM) detector?
(What IS the expected response of each type?)

o If the quad detector behaves like we expect an FM detector
to behave for that "DC modulated FM" signal, does it behave
any differently as we raise the modulation frequency (into
the audio range for example)? If it does, is the change
immediate as we go from "DC" to "AC" modulation, or gradual?
If it's gradual, when (over what range of modulation
frequencies) does it happen? (If there's a change like
that, what causes it? What do we need to pay attention
to in the design of the detector to make it consistent
from one unit to the next?)

o If we feed an FM signal that's modulated with a square
wave into a PM detector, what output do we expect? To make
that output back into a square wave, do we need to pass
it through an integrator (AKA LP filter) or through a
differentiator (AKA HP filter)?

(AFAIK, it's quite normal to put an FM detector's output through
a de-emphasis network--that is, a LP filter--to (nominally) match
the pre-emphasis used on the transmitter side. Unlike broadcast
and TV audio, communications FM doesn't seem to stick to a
universally accepted time constant for the pre/de-emphasis though.)

Cheers,
Tom

For a whole whopping 1/2 S-point more gain the larger yagi's only good point is its nulls and F/B ratio to put some noise in.

I agree that the 3-el yagi is a well known design and will work as advertised using any of the large number of mechanical and matching designs out there, where as the horizontal loop is pretty uncommon in the books.

I'd build the loop though, it is much smaller physically which I can use in my limited space and I like fooling with 'exotic' designs, even if I shoot myself in the foot a few times, it is all the more fun that way.

A quad might be a good compromise.

This will work well in most cases but beware of static problems later,
especially with meter movements. This can be overcome by finishing with a
light spray of Static Guard or some other anti-static spray.

In all cases, you will get an output from the detector whose
average value will be directly related to the input frequency
deviation. You will also get a bunch of other stuff in the
process which can be filtered out with a low pass filter. The
detector itself whether you talk about a quad, Foster-Seily (sp?)
ratio detector, etc perform this through phase comparison. One
exception could be the slope-detector which uses an IF filter
with the centre frequency moved off the IF so that the incoming
FM signal is given AM sidebands related to the FM dev. The
signal then is AM detected and then post processed. This is
used in some of the broadcast radios and TV's. BTW, in IC's
it is easy to build a phase detector in a small area so the
AM detection can be easily done with synchronous detection.

> o If we feed an FM signal that's modulated with a square
> wave into a PM detector, what output do we expect? To make
> that output back into a square wave, do we need to pass
> it through an integrator (AKA LP filter) or through a

> differentiator (AKA HP filter)?

I see the above as a two part question. The square wave is comprised of many frequencies and so you must do your normal detection and filtering such that enough of the higher freq's get through so that a square output can be obtained. As far as the de-emphasis is concerned both commercial broadcast and commercial two-way products must comply to standards set by agencies such as EIA, TIA, CEPT, etc. If someone decides that the pre-emphasis should be 12db/octave instead of 6, then they are on their own and you can only guess as to what to do about it. In the case of de-emphasis, the roll off is done on the in band and useful stuff and the low pass filter on the detector takes care of the non-useful stuff outside the desired freq range.

I think some of the other questions coming up about this whole thing relate more to do with what is done with the recovered audio rather than the detection, but that is an area I leave to the digital designers.

Just use a *good* wall-wart if its a solid state radio.

I'm not so sure you even need "good". Assuming it's a regular car radio, it will probably work on anything from 12 - 15 volts, likely could stand more, probably pretty immune to noise, might be bothered if the wall wart has a lot of ripple, but I bet not.

If there is too much hum from the wall wart, I'd just put a 12 volt regulator on the output of the wall wart. Again, assuming it's not some high powered stereo or transceiver, I would think nothing fancier than a 3 terminal regulator would do it. Wall warts are easier to come by and cheaper than trying to find the right transformer.

Any idea how much current this radio needs?

ugly/manhattan building projects with no problems.
3/$1.35 (or send a buck and a stamp)

Transistors
==========
2N2222A'S in plastic TO92, NPN - 50/$4.50 NEW PARTS
2N3906's plastic TO92. PNP - 50/$4.00 NEW PARTS
2N3704's plastic TO92, NPN - 50/$4.00 NEW PARTS

I AM OUT OF METAL 2N2222'S!!! BUMMER!!

IRF540's TMOS Power FET, N-Channel, 27A, 100v RDS(on) = .070 Ohms
http://www.onsemi.com/pub/Collateral/IRF540-D.PDF for data sheet
$1.00 each.

BC847B - Surface Mount NPN's, general purpose
CBO = 50v, CEO = 45v, EBO = 6v, Collector Current Max = 100 mA,
electrical characteristic curves for this unit are the same as the
PN2222A, SST222A, MMST2222A, and UMT222A transistor. These are new
stock, on SM tape.
100pcs/$2.50

2N2700 MOSFET - 5/$2 10/$3.50

Crystals
========
3.579545 Mhz Crystals for 80m - These are pulled colorburst crystals,
2/$1

POTS
====
10K 1 Turn Panel mount pots. These are pulls. No knobs, just
shafts. Most are Allen Bradley. Pot is about as big as a quarter.
With nut. 5/$4.00

Diodes
======
1N4148 - You always need these. 75 for $2.00 These are NEW.

Let me know if you're interested. All prices are post paid to the
USA, unless otherwise noted. I will ship to non USA addresses but we
need to discuss the shipping charges first.

Go to Radio Shack and get one of their solid state project books and read up
on making one,
then buy one of their power supplies. By the time you get all the parts,
case,tools. and test
meter to see if it's working right, you've spent three times the price.

8041. Thanks guys

Thanks: It's just that I had an old 1.75Amp converter that needed a couple of condensers that I could not find. I always seem to do things the hard way:-)

Try Maguire's plastic cleaner. Have used it for years here, a little of the liquid goes a long way. We used it in the phone company for cleaning and polishing the plastic parts in phone booths and the dials on the old 500 sets. Works very well, polishes out all but the worst scratches. Should still be available in automotive parts stores. Got a touch left, but will be looking for some soon myself.

8043. Need help figuring out one-stage circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 2001-12-31 23:00:52 UTC
From: "Clifton T. Sharp Jr." <clifto@clifto.com>

Source record: 47740

This one's part of a Radio Shack "AM / shortwave radio" demonstrator they put on clearance a while back. I can't make sense of the stage I'm looking at.

The ferrite-or-powdered-iron (I can't tell which) loopstick has two windings. The larger is paralleled with the tuning capacitor. One end of the takeoff winding goes to the base of a 2SC945. Collector supply: 9V battery through 1K resistor to a 33 uF cap sets the "master" supply voltage; from there through a 3.9K and then a 200 uH coil to the collector. Base biasing via 330K from collector to base. Output from collector through 0.1 uF cap to anode of a germanium diode, diode cathode has 0.05 uF to ground and then goes to the other end of the takeoff coil. Emitter is at ground. Circuit stage output from the transistor collector to a two-stage audio amp.

In practice it works terribly. It clips on all but the weakest stations ("weakest" example is a 5 KW station 20 miles from here). Yes, it's wired right. I did find one stoopid misteak already. (Had swapped a 1K and a 10K.)

Anyone have any clues for me as to how this circuit is *supposed* to work? I'm baffled. I can only guess they're trying to feed audio back through the takeoff coil for extra amplification. My guess as to how the biasing *should* work doesn't come close to measurements, etc. etc.

P.S.: I bought it for the ferrite-or-powdered-iron rod. I *thought* I'd be able to toss the rest. I oughta know better by now.

My house is filled with projects just like that one. :)

What capacitors do you need? Bet you can find them on the web.

These days a 3A regulated supply doesn't cost much more than $40, and I've
seen a few under $25 at hamfests.

Thanks one and all. Got more than enough information.

Again thanks and Happy New Year.
